## Table of Contents

1.	Introduction.....	9
2.	Traffic Demand and Junction Modelling.....	11
3.	Economic Appraisal Methodology.....	54
4.	Core Travel Time Benefits .....	66
5.	High Growth Scenario Travel Time Benefits .....	71
6.	Low Growth Scenario Travel Time Benefits.....	76
7.	Road Safety.....	81
8.	Economic Appraisal .....	85
9.	OBR Sensitivity Test .....	100
10.	Induced Investment .....	104
11.	Analysis of Monetised Costs and Benefits – Induced Investment.....	107
12.	Summary and Conclusions.....	110
	Summary.....	110
	Conclusions.....	110
	Appendix A – Route Choice Comparisons.....	113
	Appendix B – Sensitivity testing MCHM .....	114
	Appendix C – Trafficmaster Average Vehicle Delay .....	116
	Appendix D – BY Desire Line Plots and Turning Movements.....	117
	Appendix E – Base Year Flows .....	118
	Appendix F – Base Year Turning Movements by Vehicle Type.....	119
	Appendix G – Observed Public Service Vehicle Flows.....	120
	Appendix H – Nottinghamshire County council Bus Map .....	121
	Appendix I – Dependent Development TN .....	122
	Appendix J – Development Site Trip Distributions.....	123
	Appendix K – TRICS Outputs.....	124
	Appendix L – Committed Development Housing Trajectory .....	125
	Appendix M – Committed Development Flows.....	126
	Appendix N – 2023 Opening Year Forecasts .....	127
	Appendix O – 2037 Design Year Forecasts.....	128
	Appendix P – 2023 & 2037 Junction Turning Movements.....	129
	Appendix Q – AADT Calculation.....	130
	Appendix R – AADT Flows .....	131
	Appendix S – Ollerton Roundabout Scheme Drawing and ARCADY Outputs.....	132
	Appendix T – Deerdale Scheme Drawing and PICADY/LINSIG Outputs .....	133
	Appendix U – Mickledale Lane Scheme Drawing and PICADY/LINSIG Outputs .....	134
	Appendix V – Lowdham Scheme Drawing and ARCADY Outputs .....	135
	Appendix W – Kirk Hill Scheme Drawings and LINSIG Outputs.....	136
	Appendix X – Appraisal Cost Proforma .....	137
	Appendix Y – Ollerton TUBA Files.....	138
	Appendix Z – Mickledale Lane TUBA Files .....	140

Appendix AA – Lowdham TUBA Files.....	141
Appendix BB – Kirk Hill TUBA Files.....	142
Appendix CC – Annualisation Process.....	143
Appendix DD – Delays During Construction.....	144
Appendix EE – Maintenance Costs.....	145
Appendix FF – COBALT Outputs .....	147
Appendix GG – Noise TAG Workbook.....	148
Appendix HH – Air Quality TAG Workbook.....	149
Appendix II – DEFRA Emission Factor TAG Workbooks.....	150
Appendix JJ – Wider Economic Impacts Report .....	151

# 1. Introduction

1.1 Nottinghamshire County Council (NCC) is promoting junction improvements at a series of locations on the A614 – A6097 corridor as a single scheme package. These junctions are:

- A614 / A616 / A6075 roundabout (hereafter referred to as the Ollerton roundabout);
- A614 / Eakring Road / Deerdale Lane crossroads (hereafter referred to as Deerdale Lane);
- A614 / Mickledale Lane crossroads (hereafter referred to as Mickledale Lane);
- A614 / Mansfield Road roundabout (hereafter referred to as the White Post roundabout);
- A614 / A6097 junction priority junction (hereafter referred to as the Warren Hill junction); and
- A6097 / A612 Nottingham Road / Southwell Road roundabout (hereafter referred to as the Lowdham Roundabout).
- A6097 / Kirk Hill // East Bridgford Road (hereafter referred to as Kirk Hill Junction).

1.2 The locations of the junctions are shown in Figure 1-1.

Figure 1-1: Junction Locations

- 1.3 The options considered, scheme development and design considerations are presented in the Options Assessment Report (OAR).
- 1.4 This report sets out the traffic forecasting calculations, and the economic assessment for the scheme. It calculates both the value of benefits and costs of the scheme and presents an overall *Benefit to Cost* ratio.
- 1.5 The outputs from the work detailed in this report will be used to support an application for funding from the Department for Transport's (DfT) Major Road Network (MRN) programme.

## 2. Traffic Demand and Junction Modelling

### Introduction

2.1 The relationship between the appraisal process and decision-making process is set out in the Department for Transport's Transport Analysis Guidance (TAG).

[https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment\\_data/file/712693/tag-tpm-guidance-senior-responsible-officer-may-18.pdf](https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/712693/tag-tpm-guidance-senior-responsible-officer-may-18.pdf)

2.2 The TAG guidance identifies three stages of appraisal:

- Stage 1 – Option Development;
- Stage 2 – Further Appraisal
- Stage 3 – Implementation and Benefits Management, Monitoring and Evaluation

2.3 The six junctions identified as part of the improvement package are in Stage 1 of the appraisal process.

2.4 There are 3 approaches that could be taken to determining the economic assessment of this scheme:

- Using a macroscopic model such as SATURN; or
- Using a microsimulation model; or
- Using the outputs from isolated junction models.

2.5 No suitable existing macro or microscopic model is available for the study area. The models that do cover the geographic region are strategic in nature and are not suitable for the assessment of modest junction improvements with local connections. Highways England's Midlands Regional Transport Model (MRTM) covers the geographic area of the scheme and Nottingham City Council's East Midlands Gateway Model (EMGM) covers the A614 between A614/A617 Lockwell Hill junction and A6097 but excludes the Deerdale Lane, Mickledale Lane and Ollerton junctions. Both models would require significant work to disaggregate the coarse zoning systems around the scheme to enable suitable representation of peak hour turning movements at the scheme junctions to provide robust assessment. Both models would also require extensive network updates to represent the local highway network and loading points. The model updates would require a new Base Year calibration and validation against TAG criteria. Local development assumptions in the area surrounding the scheme would need to be incorporated into the bespoke forecasting procedures.

2.6 The work identified to update the MRTM and EMGM is not considered proportionate and could not be delivered within the delivery timeframe.

2.7 Whilst the distance between the northern and southern most junctions is 14.5 miles, there is little route choice involved for which macroscopic models are most often deployed. Route choice comparisons are presented in Appendix A. The development of a new macroscopic model would require the collection of new trip demand data at a disaggregate level to ensure local trip patterns are reflected appropriately. The development of a new macroscopic model is not considered proportional to the size of the scheme, in accordance with TAG Unit M1, sections 2.3 to 2.4.

2.8 Similarly, the development of a new 14.5-mile micro-simulation corridor model, is not considered to be proportionate.

2.9 TAG unit M2 – Variable Demand Modelling, May 2019, section 2.2 discusses the requirement for Variable Demand Modelling. Paragraph 2.2.1 states:

*It may be acceptable to limit the assessment of a scheme to a fixed demand assessment if the following criteria are satisfied:*

- *The scheme is quite modest either spatially or financially and is also quite modest in terms of its effect on travel costs. Schemes with a capital cost of less than £5 million can generally be considered as modest; or the following two points:*
  - *There is no congestion or crowding on the network in the forecast year (10 to 15 years after opening), in the absence of the scheme; and*
  - *The scheme will have no appreciable effect on travel choices (e.g. mode choice or distribution) in the corridor(s) containing the scheme.*

2.10 TAG unit M2 – Variable Demand Modelling, paragraph 2.2.4 notes that:

*In order to establish a case for omitting variable demand in the model, preliminary quantitative estimates of the potential effects of variable demand on both traffic levels and benefits should be made.*

2.11 TAG unit M2 – Variable Demand Modelling, paragraph 2.2.5 also notes that:

*An existing variable demand model of the area should be used for the purpose of testing if one is available.*

2.12 Of the three criteria identified in TAG M2, paragraph 2.2.1, the cost of the combined improvement package is well in excess of £5m. There is predicted to be journey time delays at several of the scheme junctions in the forecast scenarios. However, the scheme is unlikely to have appreciable effect on travel choice given the limited public transport options along the corridor and the lack of route choice (detailed in Appendix A). The preliminary estimates of the potential effects of variable demand set out TAG M2, paragraphs 2.2.4 and 2.2.5 is dependent on a suitable variable demand model of the area. As discussed in paragraph 2.5 above, the two available models that cover the geographic area of the scheme do not have a suitable level of detail to reflect the potential variable demand effects resulting from the scheme. To upgrade the existing models to a suitable standard would require significant work as set out in paragraph 2.5 above. The use of a fixed trip assessment is considered the most appropriate assessment approach, particularly given the lack of a suitable macro transport model.

2.13 Of the six junctions to be improved, the closest pair is 1km apart. The distance between the scheme junctions mean that the delay at each junction is considered independent of the adjacent junction and given, the lack of alternative route choice, the preferred and proportionate methodology would be to assess each junction in isolation before combining the costs and benefits to present an overall package of improvements.

2.14 A limitation of this approach is that the full trips lengths are not modelled within the isolated junction models meaning the economic assessment may overestimate benefits relating to the change in fuel consumption (vehicle operating costs, greenhouse gases and indirect taxes). This is discussed in detail in Section 3 in more detail. So as not to overestimate, assessments based on the change in fuel consumption have been excluded from the economic appraisal, providing a robust assessment.

2.15 The use of isolated junction models and a fixed trip assessment will not capture the effects of rerouting but as noted above, there is limited route choice along the corridor (presented in Appendix A) meaning the effects of reassignment in both the Do Minimum and Do Something scenarios is expected to be minimal.

2.16 To provide additional assurance to the decision to use a fixed trip assessment, sensitivity testing was undertaken using the Midlands Connect Highway Model (MCHM). This work, presented in Appendix B, uses MCHM to look at potential Variable Demand and reassignment impacts, noting the model does not represent the A614/A6097 in sufficient detail to support detailed scheme appraisal (The MCHM contains representation of only three of the scheme junctions).

2.17 The work concludes that:

- Fixed demand assignment testing of the improvements produces minor re-routing responses along the scheme corridor, principally due to the lack of other routing options to cross the River Trent.

- Increases in demand along the scheme corridor arising from the fixed demand assignments are small, but most prominent on the A6097 Oxton Bypass.
- VDM elicits minimal change in either the matrices or the assignment, when the pre and post VDM matrices are assigned and the model outputs compared.
- The reassignment and VDM impacts are not considered material in either the economic or environmental appraisal. As such, a fixed-trip assessment is considered appropriate.

2.18 The approach to scheme appraisal has therefore been to:

- Confirm the feasibility of options at each junction location via initial assessment using isolated junction modelling (i.e. ARCADY, PICADY and LINSIG) – reported in the Option Assessment Report;
- Prepare indicative design drawings of the preferred option – reported in the Option Assessment Report;
- Use the indicative design drawings to prepare a construction cost estimate (including an allowance for land, utilities and services);
- Apply local future growth to existing Manual Classified Turning Counts and Queue Surveys at each of the scheme junctions to produce an Opening Year and Design Year traffic forecasts;
- Use isolated junction models (i.e. ARCADY, PICADY and LINSIG) to identify:
  - Baseline delays;
  - Future years Do Minimum delays (ie without scheme);
  - Future years Do Something (i.e. with option delays)
- Monetise delays from the isolated junction models using the values of time in the WebTAG databook and expand over a 60 year assessment period using the DfT's latest TUBA software (version 1.9.12, January 2019).
- Use existing accident records to inform a COBALT accident appraisal at each junction.
- The Present Value of Benefits and Present Value of Costs (assuming a 2010 base year) has been calculated to identify the scheme BCR. Whilst each junction has been assessed individually, the PVB and PVC from each junction have been combined to present an overall economic appraisal of the A614/A6097 Improvements.

2.19 This approach was discussed with the Department for Transport in a project inception meeting held on 14<sup>th</sup> November 2018 and in subsequent meetings and correspondence throughout 2020.

# Baseline Traffic Conditions

## Traffic Survey Data

2.20 According to the document, *How the National Road Traffic Estimates are Made* (DfT, 2007), traffic counts are normally undertaken during the 'neutral' months of March, April, May, June, September and October (but outside of school holidays). This is to ensure seasonal impacts are minimised.

2.21 The Manual Classified Counts (MCCs) undertaken to support this study were undertaken on the following dates:

- Ollerton Roundabout – 29th June 2017;
- Deerdale Lane – 27th September 2017;
- Mickledale Lane - 27th September 2017;
- White Post – 11th October 2018;
- Warren Hill – 20th September 2018; and
- Lowdham – Thursday 7th June 2018.
- Kirk Hill – Wednesday 9<sup>th</sup> October 2019

2.22 For the MCCs, all possible traffic movements were recorded in 15 minutes intervals, between the times of 07:00 – 19:00hrs. The following classifications were used:

- PC – Pedal cycles using the road; this does not include cyclists using the pavement.
- MC – Two wheeled motorcycles;
- Car – Including taxis, state cars, 'people carriers' and other passenger vehicles (for example, minibuses and camper vans) with a gross vehicle weight of less than 3.5 tonnes, normally ones which can accommodate not more than 15 seats. Three- wheeled cars, motor invalid carriages, Land Rovers, Range Rovers and Jeeps and smaller ambulances are included. Cars towing caravans or trailers are counted as one vehicle;
- LGV – Light Goods Vehicle. Includes all goods vehicles up to 3.5 tonnes gross vehicle weight (goods vehicles over 3.5 tonnes have sideguards fitted between axles), including those towing a trailer or caravan. This includes all car delivery vans and those of the next larger carrying capacity such as transit vans. Included here are small pickup vans, three-wheeled goods vehicles, milk floats and pedestrian controlled motor vehicles. Most of this group are delivery vans of one type or another;
- OGV1 – Other Goods Vehicles Category 1. Includes all rigid vehicles over 3.5 tonnes gross vehicle weight with two or three axles. Includes larger ambulances, tractors (without trailers), road rollers for tarmac pressing, box vans and similar large vans. A two or three axle motor tractive without a trailer is also included;
- OGV2 – Other Goods Vehicles Category 2. Includes all rigid vehicles with four or more axles and all articulated vehicles. Also included in this class are OGV1 goods vehicles towing a caravan or trailer;
- PSV – Buses and Coaches. Includes all public service vehicles and works buses with a gross vehicle weight of 3.5 tonnes or more, usually vehicles with more than 16 seats.

2.23 Queue length surveys were also conducted. The queue length data was collected on the following dates:

- Ollerton Roundabout – 29th June 2017;
- Deerdale Lane – 27th September 2017;
- Mickledale Lane - 27th September 2017;

- White Post – 12th December 2018;
- Warren Hill – 20th September 2018; and
- Lowdham – Thursday 13th December 2018.
- Kirk Hill – 9<sup>th</sup>, 10<sup>th</sup> and 11<sup>th</sup> October 2019

2.24 The length of queues was recorded at each junction between 07:00 – 10:00hrs & 16:00 – 19:00hrs, every five minutes.

2.25 Table 2.1 to Table 2.6 present the observed base year MCC data and a summary of the queue data. The validity and appropriateness of the MCC data and queue surveys was reviewed against long term permanent automatic traffic counts which are discussed in more detail below. Queue surveys were logic checked against live and 'typical' traffic sources (Google Traffic), as well as Trafficmaster delay plots (presented in Appendix C) to ensure the queue data was representative. In addition, the project team have a thorough local knowledge of the A614/A6097 corridor having delivered multiple improvements along the route in recent years and were therefore able to apply logic checks to the data used in the assessment.

2.26 Baseline turning movements at the scheme junctions, highlighting the major movements, are presented in Appendix D. This data is provided by vehicle type, direction and time of day.

2.27 In addition, Automatic Traffic Count (ATC) data was also available from permanent count locations on the A614 / A6097. The following count locations were examined within the study:

- A614 Bilsthorpe (N) – Site ID: 000030306363
- A614 Bilsthorpe (S) – Site ID: 000030306359
- A6097 Warren Hill (S) – Site ID: 000035206253
- A6097 Lowdham (N) – Site ID: 000030806547
- A6097 Lowdham (S) – Site ID: 000030006745

2.28 Figure 2-1 locates all count site locations used within the study.

Figure 2-1: Count Site Locations

2.29 For the purpose of the study, all raw traffic count data has been converted into Passenger Car Units (PCUs), to represent the impact of the particular mode on the highway network in comparison to a single car. The following PCU factors have been used:

- Bicycle: 0.2
- Motorcycle: 0.4
- Car: 1.0
- Light Goods Vehicle (LGV): 1.0
- Single-Unit Trucks / Medium Goods Vehicle (MGV): 1.5
- Public Service Vehicles (including Buses): 2.0
- Articulated Trucks / Heavy Goods vehicle (HGV): 2.3

## Peak Hours

2.30 The manual classified count (MCC) surveys at the six junctions were recorded in 15-minute intervals. Analysis of the MCC data was undertaken to identify the busiest 60-minute segment in both the AM (07:00 – 10:00hrs) and the PM (16:00 – 19:00hrs) peak periods. Table 2.7 shows the analysis for each junction.

**Table 2.7: Network Peak Hour**

Junction	Peak traffic flow hour (AM Peak)	Peak traffic flow hour (PM Peak)
Ollerton Roundabout	07:45 – 08:45	16:15 – 17:15
Deerdale Lane	07:30 – 08:30	16:45 – 17:45
Mickledale Lane	07:15 – 08:15	16:45 – 17:45
White Post	07:15 – 08:15	16:30 – 17:30
Warren Hill	07:30 – 08:30	16:30 – 17:30
Lowdham Roundabout	07:45 – 08:45	17:00 – 18:00
Kirk Hill	07:45 - 08:45	16:45 – 17:45
<b>Average Network Peak Hour</b>	<b>07:30 – 08:30</b>	<b>16:30 – 17:30</b>

2.31 From the individual junction peak hours, a common network peak hour was identified by selecting the hour period which incorporated the majority of the individual junction peak hours identified in Table 2.7. The network peak hours were identified as 07:30 – 08:30hrs and 16:30 – 17:30hrs. All but one of the junction peak hours fell within 15-minutes of these network peak hours. These network peak hours were used as the AM and PM peak hours on which the analysis was based. This approach ensures consistency of traffic flows along the route used in the appraisal. In the AM peak, the junctions where the individual peak fell outside of this hour all had 45 minutes of the individual peaks included in the network peak hour. In the PM peak, the junctions which have an individual peak which fell outside of the network had 45 minutes of the individual peak hour included in the network peak hour, with the exception of Lowdham which has 30 minutes represented. The impact of this approach is a small underestimation of the peak hour demands which would underestimate the potential benefits of the scheme. This network-wide approach is a proportionate and robust approach to transport economic assessment.

2.32 Table 2.8 to Table 2.13 below present the observed inflows to each junction within the four 15-minute periods of the junction peak hours identified in Table 2.7. This shows that the use of an average peak hour for all junctions will not materially affect the appraisal.

**Table 2.8: Ollerton – 15-minute profile within junction peak hour**

AM Time Period	AM Inflow (veh/hr)	PM Time Period	PM Inflow (veh/hr)
0745 - 0800	641	1615 - 1630	599
0800 - 0815	645	1630 - 1645	596
0815 - 0830	661	1645 - 1700	616
0830 - 0845	603	1700 - 1715	679

**Table 2.9: Deerdale – 15-minute profile within junction peak hour**

AM Time Period	AM Inflow (veh/hr)	PM Time Period	PM Inflow (veh/hr)
0730 - 0745	536	1645 - 1700	511
0745 - 0800	473	1700 - 1715	477
0800 - 0815	536	1715 - 1730	510
0815 - 0830	497	1730 - 1745	459

**Table 2.10: Mickledale – 15-minute profile within junction peak hour**

AM Time Period	AM Inflow (veh/hr)	PM Time Period	PM Inflow (veh/hr)
0715 - 0730	532	1645 - 1700	561
0730 - 0745	551	1700 - 1715	500
0745 - 0800	497	1715 - 1730	546
0800 - 0815	541	1730 - 1745	498

**Table 2.11: White Post – 15-minute profile within junction peak hour**

AM Time Period	AM Inflow (veh/hr)	PM Time Period	PM Inflow (veh/hr)
0715 - 0730	587	1630 - 1645	562
0730 - 0745	642	1645 - 1700	619
0745 - 0800	642	1700 - 1715	607
0800 - 0815	643	1715 - 1730	616

**Table 2.12: Warren Hill – 15-minute profile within junction peak hour**

AM Time Period	AM Inflow (veh/hr)	PM Time Period	PM Inflow (veh/hr)
0730 - 0745	523	1630 - 1645	472
0745 - 0800	518	1645 - 1700	489
0800 - 0815	493	1700 - 1715	453
0815 - 0830	422	1715 - 1730	455

**Table 2.13: Lowdham – 15-minute profile within junction peak hour**

AM Time Period	AM Inflow (veh/hr)	PM Time Period	PM Inflow (veh/hr)
0745 - 0800	817	1700 - 1715	918
0800 - 0815	886	1715 - 1730	904
0815 - 0830	952	1730 - 1745	805
0830 - 0845	945	1745 - 1800	822

2.33 In addition to the AM and PM peak hours, the assessment is also concerned with traffic conditions during the Inter Peak and Off Peak hours. The Inter peak is defined as the average hour between 10:00 – 16:00hrs, whilst the Off Peak is defined as the average hour between 22:00 – 06:00hrs.

2.34 Given this, the following time periods were examined throughout the study:

- AM Peak: 07:30 – 08:30hrs;
- PM Peak: 16:30 – 17:30hrs;
- Inter Peak: 10:00 – 16:00 (average hour);
- Off Peak: 22:00 – 06:00 (average hour);

### Baseline Traffic Flows

- 2.35 As the MCCs only recorded vehicles passing through the junction, vehicles that were recorded as queuing at the end of each of the peak sixty-minute periods have also been added to the recorded traffic flow (proportioned to each individual turning movement) so that the full demand through each junction is identified. This ensures that any new scheme can be designed to cater for the full hourly demand.
- 2.36 To account for any seasonality effects associated with the month of collection of the MCC surveys, a seasonality factor was applied at this stage which was based on long-term traffic count data provided by NCC for the A614 corridor.

$$\text{Baseline} = (\text{Junction MCC} + \text{Queuing Traffic at Period End}) * \text{Seasonality Factor}$$

- 2.37 The seasonality factor was calculated by finding the average two-way weekday flow for each month at 5 permanent count sites on the A614 / A6097 corridor (identified in Figure 2-1 above). This was used to find the percentage difference between the AAWT (Average Annual Weekday Traffic) flow and the monthly average, which was then applied to the months of traffic data collection to account for any seasonality impacts associated with differing months of data collection.
- 2.38 The seasonality factor was calculated to be 4.1%.
- 2.39 The approach to using long term traffic data to derive a seasonality factor is consistent with DMRB, Volume 12, Section 1, Part 1 guidance.
- 2.40 Diagrams showing the traffic flow through each of the study area junctions are shown in Appendix E. Appendix F presents total base year flows for links approaching each junction and the observed turning movements at each junction by vehicle type and time period.
- 2.41 To examine the temporal variation of traffic flows along the corridor, permanent count site data available through the C2 database has been examined for the period 1<sup>st</sup> January 2018 – 31<sup>st</sup> December 2018 (i.e. the most up-to-date full year of traffic data). The following permanent counts sites have been examined to represent the full corridor:
- A614 Bilsthorpe (N) – Site ID: 000030306363
  - A614 Bilsthorpe (S) – Site ID: 000030306359
  - A6097 Warren Hill (S) – Site ID: 0000352206253
  - A6097 Lowdham (N) – Site ID: 000030806547
  - A6097 Lowdham (S) – Site ID: 000030006745
- 2.42 The average hourly weekday traffic flows (excluding bank holidays) have been calculated across the five sites to show the temporal variation in traffic flows on the corridor across the day. Figure 2-2 shows the variation across the day in the northbound direction, whilst Figure 2-3 shows the southbound. Figure 2-4 summarises the two-way flow.

Figure 2-2: Average weekday hourly traffic flow across the A614 / A6097 corridor – Northbound

Figure 2-3: Average weekday hourly traffic flow across the A614 / A6097 corridor – Southbound

**Figure 2-4: Average weekday hourly traffic flow across the A614 / A6097 corridor – Two-way**

- 2.43 The data in Figures 2.2 to 2.4 identifies two clear peak periods across the corridor, typically between 0700 – 0900 hrs in the morning and 1600 – 1800 hrs in the evening. The network peak hours used throughout this report (identified as 0730 – 0830 and 1630 – 1730 in Table 2.1) fall within these peak periods.
- 2.44 Furthermore, the graphs indicate that traffic flows along the A614 – A6097 corridor are tidal, whereby traffic flows are higher in the morning peak in the southbound direction, whilst in the evening peak traffic flows are greatest in the northbound direction.
- 2.45 The C2 data was also utilised to show variation across the year, with the average weekday flows per month shown in Figure 2-5 for the northbound and Figure 2-6 for the southbound. The two-way average traffic flows by month are shown in Figure 2-7.

**Figure 2-5: Average monthly (weekday) traffic flow across the A614 / A6097 corridor – Northbound**

Figure 2-6: Average monthly (weekday) traffic flow across the A614 / A6097 corridor – Southbound

Figure 2-7: Average weekday hourly traffic flow across the A614 / A6097 corridor – Two-way

2.46 Figure 2-5 to Figure 2-7 identify that traffic flows are greatest in the summer months, with the two-way traffic flow highest in May. January and December see the lowest traffic flow.

2.47 To show annual changes to traffic flows across the corridor, historic count data available through the DfT manual count point database has been utilised for three sites across the network corridor:

- A614 Bilsthorpe (S) – Site number 17302;
- A614 White Post – Site number 47379; and
- A6097 Epperstone By-Pass – Site number 27820.

2.48 Figure 2-8 shows the Annual Average Daily Flow in the northbound direction as an average across the three sites, whilst Figure 2-9 shows the southbound direction. The variation in two-way flow is shown in Figure 2-10.

Figure 2-8: Average Annual Daily Flow, averaged for the three sites on the corridor - Northbound

Figure 2-9: Average Annual Daily Flow, averaged for the three sites on the corridor – Southbound

**Figure 2-10: Average Annual Daily Flow, averaged for the three sites on the corridor – Two-way**

2.49 The data presented in Figure 2-8 to Figure 2-10 shows no obvious temporal relationship, with AADT flows observed to vary year-on-year.

**Public Transport Flows**

2.50 The number of buses routing through each of the junctions recorded during the MCC counts are shown Table 2.14. Full junction diagrams are shown in Appendix G, which show the turning movements of buses at each of the junctions.

**Table 2.14: Buses routing through each scheme junction – derived from MCC data**

Junction	Buses routing through junction		
	AM	PM	IP
Ollerton	26	9	17
Deerdale Lane	10	2	6
Mickledale Lane	12	4	6
White Post	12	9	8
Warren Hill	6	6	5
Lowdham	18	8	10
Kirk Hill	5	5	2

2.51 The following services route along or through the study area:

- 14 / 15 / 15A - Stagecoach (Mansfield / Walesby / Kirton). Routes through:
  - Ollerton Roundabout
- Sherwood Arrow – Stagecoach (Worksop / Retford / Ollerton / Nottingham). Routes through:
  - Ollerton Roundabout
  - Deerdale Lane
  - Mickledale Lane
  - White Post
  - Warren Hill
- 28 – Stagecoach (Mansfield / Blidworth / Farnsfield / Southwell / Averham / Newark). Routes through:
  - White post
- 27x / 28 – Stagecoach (Mansfield / Blidworth / Bilsthorpe / Eakring). Routes through:
  - White post
- 29 – Stagecoach (Mansfield / Blidworth / Farnsfield / Southwell / Upton / Newark). Routes through:
  - White Post
- The Calverton – Trent Barton (Calverton / Arnold / Nottingham)
- 26 / 26A / N26 – Nottingham City Transport (Southwell / Brackenhurst / Lowdham / Burton Joyce / Nottingham) Route through:
  - Lowdham
- 354 – Nottsbus Connect (Newark - Elston - Bingham - Orston) Route through:
  - Kirk Hill

2.52 Services operating only one day per week (such as Shopper services) have not been included due to their low frequency.

2.53 Appendix H shows a map of bus services within the study area

2.54 Personal Service Vehicles (PSVs), including buses, have been accounted for within junction modelling by using Passenger Car Units (PCUs) as the unit of traffic volume. Each bus was assigned a PCU value of 2, which accounts for the greater impacts larger vehicles have upon traffic variables (e.g. capacity, road surface degradation etc.).

2.55 In addition, buses (and other large vehicles) have also been accounted for within junction design (described in detail within the Options Appraisal Report (OAR)).

### Pedestrians and cyclists

2.56 No specific pedestrian and cyclists baseline data has been collected due to the rural location of the junctions and low numbers expected. However, camera surveys were utilised for turning counts at the key junctions of Ollerton, Deerdale, Mickledale and Lowdham. A review of the camera footage has been undertaken and the numbers for the whole day are shown in Table 2.15 Please note that these are limited as the camera survey was setup to capture turning counts, but it is considered that the data shows the relative low number of pedestrian and cyclists across all these junctions. As part of the detailed design further surveys will be commissioned at Lowdham due to the higher numbers observed, however, a formal controlled toucan crossing is proposed as part of the new junction layout.

**Table 2.15: Pedestrians and Cyclists at each junction – derived from camera survey**

Junction	Pedestrians	Cyclists	Date of Camera Survey
Ollerton	15	2	(29 <sup>th</sup> June 2017)
Deerdale Lane	4	6	(27 <sup>th</sup> September 2017)
Mickledale Lane	0	7	(27 <sup>th</sup> September 2017)
Lowdham	34	71 (carriageway) 34 (off-carriageway)	(7 <sup>th</sup> June 2018)

2.57 Pedestrian and cyclists' trips across all junctions are low and the number of trips local to the junctions is not available. Controlled crossing facilities for pedestrians and cyclists are included at the following locations:

- Ollerton roundabout on the A614 southern arm and across the A6075.
- Lowdham, roundabout on the A6097 northern arm, this is the key desire route between Burton Joyce / Bulcote and Lowdham and links an existing shared use footway / cycleway

## Traffic Forecast Scenarios

- 2.58 The following future year traffic forecasting scenarios have been developed:
- Opening Year Forecast - 2023;
  - Design Year Forecast (Non Dependent) - 2037; and
  - Design Year Forecast (Dependent) – 2037.
- 2.59 The 2023 Opening Year forecasts have been prepared to reflect the expected construction program of the six junctions which make up the scheme package.
- 2.60 A 2037 Design Year forecast has been produced for design purposes, which assumes all identified development is built out (Design Year Forecast (Dependent) – 2037); whilst a further 2037 forecast (Design Year Forecast (Non Dependent) – 2037) has been produced which excludes any dependent development for use in the economic assessment (i.e. this report).
- 2.61 There are no programmed transport schemes along the A614/A6097 corridor and no major nearby schemes that are likely to impact the A614/A6097. As such the surrounding existing transport network is representative of the future year transport network. There are no interim improvements planned at any of the scheme junctions.

### Committed Development

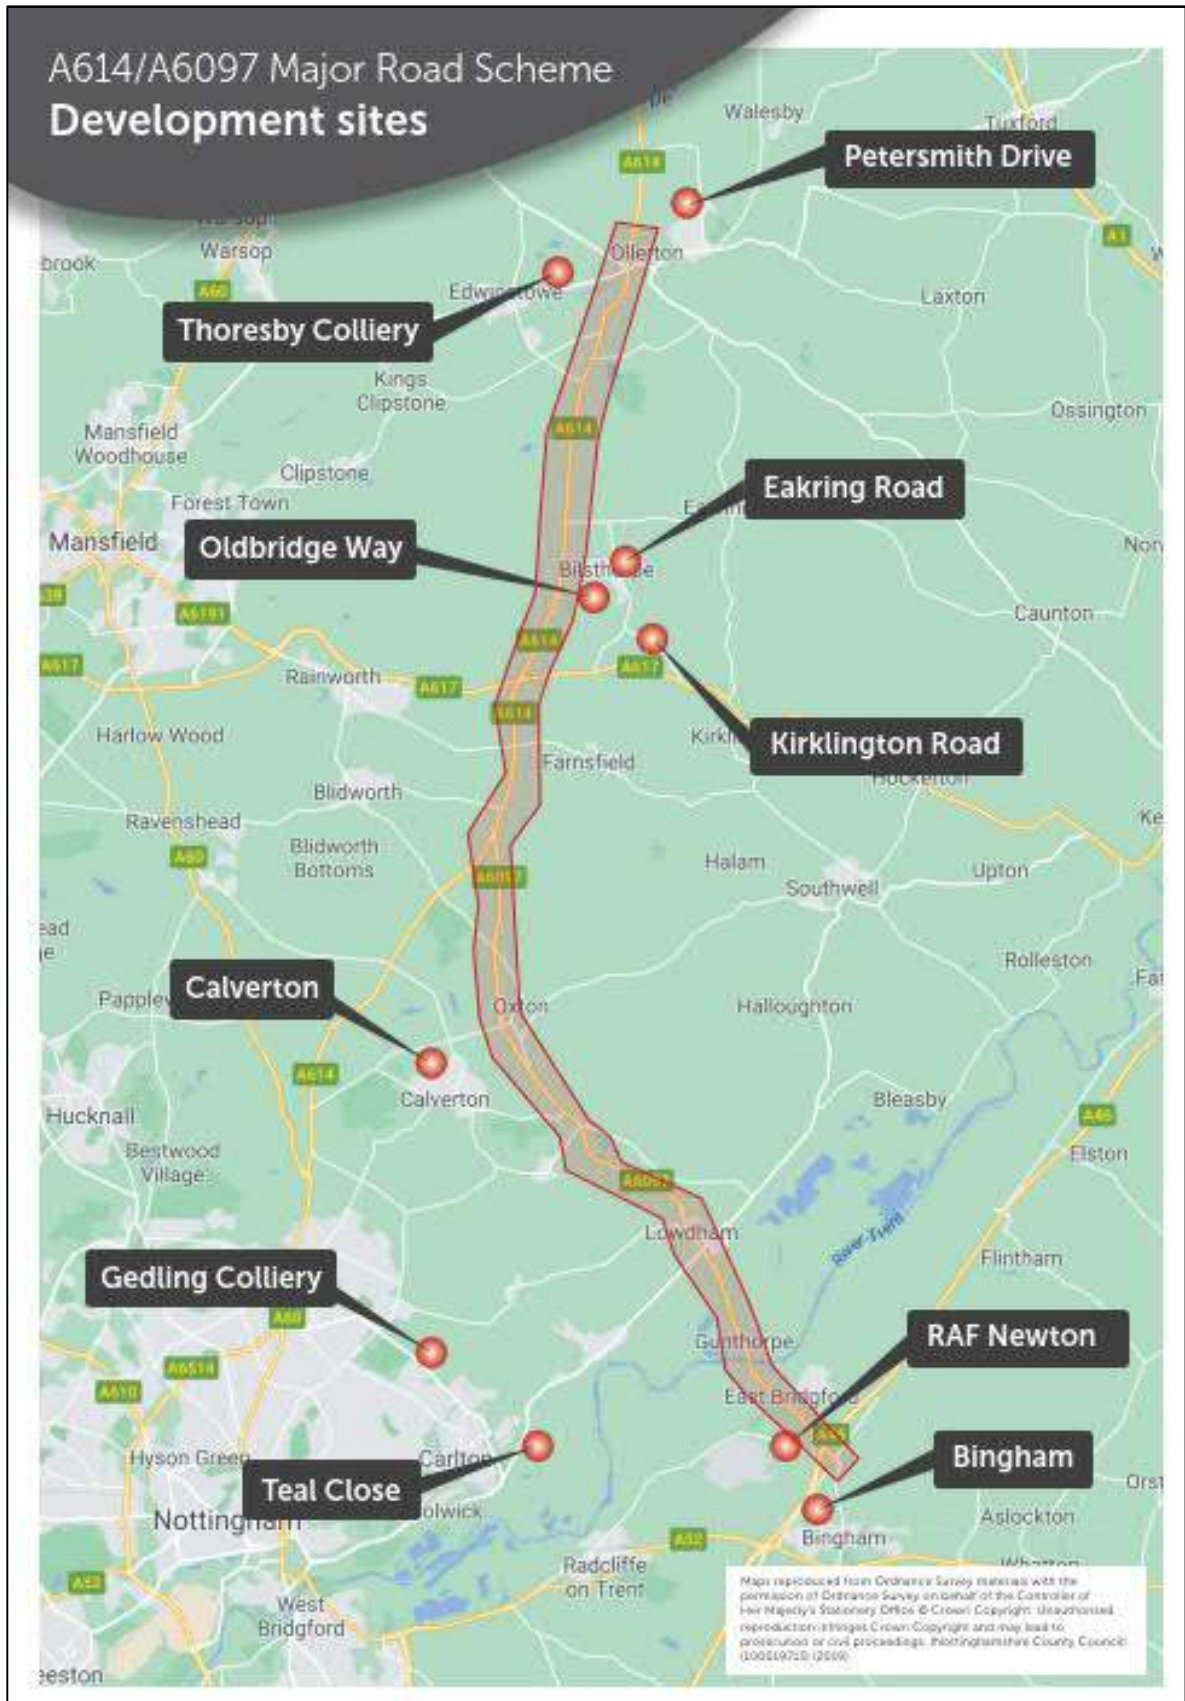

- 2.62 To suitably forecast the future traffic on the network, it is necessary to consider the additional traffic generated by the development of new housing and employment sites on, or nearby, the corridor.
- 2.63 TAG unit M4, Forecasting and Uncertainty, May 2018, section 2.2 and Table A2 defines the criteria for including known development in a core forecast. This should only include schemes where the likelihood of them going ahead is near certain, or more than likely
- 2.64 Following discussion with Nottinghamshire County Council, it was agreed to include the following committed developments, deemed to be near certain, or more than likely, in the traffic forecasts:
- Newark & Sherwood District Council:
    - Land north of Petersmith Drive;
    - Thoresby Colliery;
    - Land East of Eakring Road (Bilsthorpe Village);
    - Kirklington Road (Bilsthorpe Village);
    - Oldbridge Way (Bilsthorpe Village);
  - Rushcliffe Borough Council:
    - Land at the former RAF Newton;
    - Chapel lane, Bingham;
  - Gedling Borough Council:
    - Park Road, Calverton;
    - Land at Teal Close; and
    - Land at Chase Farm (Former Gedling Colliery).

2.65 Table 2.16 shows the development size for each committed development, as well as whether there are any planning conditions attached to the application, whilst Figure 2-11 locates the sites within the context of the A614 / A6097 corridor.

**Table 2.16: Committed Development**

Development	Planning Application Reference	Number of dwellings	Employment land	Planning Constraints?
Petersmith Drive	17/00595	305	N/A	N/A
Thoresby Colliery	16/02173	800	32,375m <sup>2</sup>	Constrained to 150 dwellings and 8,094m <sup>2</sup> employment development until improvements to Ollerton Roundabout occur
Eakring Road	17/01139	85	N/A	N/A
Kirklington Road	18/00931	136	N/A	N/A
Oldbridge Way	16/01618	113	N/A	N/A
Bingham	10/01962	1,000	55,740m <sup>2</sup>	N/A
RAF Newton	10/02105	500	15,800m <sup>2</sup>	N/A
Calverton	2018/0607	650	N/A	N/A
Teal Close	2013/0546	830	18,000m <sup>2</sup> + Car Home, Schools and Shops	Constrained to 325 dwellings until Lowdham Roundabout is upgraded
Gedling Colliery	2015/1376	1,050	N/A	N/A

Figure 2-11: Committed Development Locations

2.66 Table 2.17 shows the planning status of the most recent (and relevant) application for each development site. The decision to include each site within the Forecasting Year Core Scenario has been made in accordance with Table A2 within the Department for Transport's TAG Unit M4 document (*Forecasting and Uncertainty*).

**Table 2.17: Development Planning Status**

Development	Planning application	Planning Status	Decision date
Petersmith Drive	Full planning permission for residential development of 305 dwellings and associated development.	Application permitted	16 <sup>th</sup> August 2018
Thoresby Colliery	Outline planning permission for residential development up to 800 dwellings, employment sites (4,855sqm B1a, 13,760sqm B1c, 13,760sqm B2), Country Park, Local Centre etc.	Application permitted	12 <sup>th</sup> March 2019
	Reserved matters application for Phase 1 residential development (143 dwellings).	Application permitted	4 <sup>th</sup> December 2019
Eaking Road	Outline planning permission for residential development up to 85 dwellings, 280sqm retail development and associated works.	Application permitted	1 <sup>st</sup> June 2018
Kirklington Road	Outline planning permission for residential development up to 85 dwellings, 280sqm retail development and associated works.	Application pending	N/A
Oldbridge Way	Full planning permission for residential development of 120 dwellings and ancillary works	Application pending	N/A
Bingham	Reserved matters application for Phase 1 (317 residential dwellings) including associated infrastructure	Application permitted (conditional)	12 <sup>th</sup> February 2018
	Reserved matters application for Phase 2 (733 residential dwellings) including associated infrastructure	Application permitted (conditional)	1 <sup>st</sup> February 2019
RAF Newton	Outline planning permission (with all matters reserved) for 500 dwellings, 50 live/work units, 5.22ha new employment, 1000sqm A1,A3 and A4 uses and community uses.	Application permitted (with section 106)	30 <sup>th</sup> January 2014
	Variation of conditions to enable demolition of existing buildings	Application permitted (conditional)	29 <sup>th</sup> July 2015
Calverton	Outline planning application for up to 365 dwellings (all matters reserved except access).	Application pending	N/A
Teal Close	Reserved matters application for access, appearance, landscaping etc. related to the Local centre and employment area	Application pending	N/A
	Outline planning application for residential development (up to 830 dwellings), employment uses, community hub, primary school, hotel, care home and associated infrastructure.	Application permitted	30 <sup>th</sup> June 2014
Gedling Colliery	Planning application for the construction of an access road junction from the Gedling Access Road	Application permitted	2 <sup>nd</sup> August 2019
	Demolition of existing structures and phased development of 1,050 dwellings, local centre with retail units, health centre, and new primary school.	Application permitted	3 <sup>rd</sup> March 2017

## Dependent Development

2.67 TAG unit A2.2, Induced Investment (May 2020), notes that:

*“Dependent development refers to new development that is dependent on the provision of a specific transport scheme and for which, with the new development but in the absence of the transport scheme, the existing transport network would not provide a reasonable level of service to existing and/or new users. This has the implication that the development would not be delivered in the absence of the specific transport scheme. It is also noted that the development may have planning permission conditional on a transport investment, but this is not a prerequisite for it to be considered dependent.”*

2.68 As noted in Table 2.16 above, the development sites at Thoresby Colliery and Teal Close have planning conditions as part of their planning approval, limiting the amount of development that can be delivered prior to the improvements at Ollerton and Lowdham.

2.69 TAG unit A2.2, May 2020 notes that the level of dependency of a site is dependent on the proportion of development that may be accommodated before breaching an acceptable level of service on the transport network.

2.70 TAG Unit A2.2, paragraph 3.1.6 states:

*“There is no precise definition of reasonable level of service, such that decisions about dependency are judgement based. However, if additional traffic can be accommodated by the network without significant increases in the costs of travel for existing users, then the network can be assumed to provide a reasonable level of service. “*

2.71 TAG Unit A2.10, paragraph A2.10 states:

*“... it is assumed that in the baseline scenario the network provides a reasonable level of service. Clearly if that is not the case then the new development is likely to be wholly dependent on some form of transport scheme. However, it must be demonstrated that the baseline scenario does not provide a reasonable level of service before this conclusion can be reached.”*

2.72 Appendix I demonstrates that the Ollerton and Lowdham junctions are overcapacity in the Base Year. Any increase in trip demand in those parts of the existing highway network will result in unreasonable levels of service. Treating any of the dependent development sites as non-dependent would result in a deterioration of an already poor level of service on the local highway network. The Thoresby Colliery and Teal Close sites are therefore considered dependent.

2.73 This is consistent with TAG Unit A2.2 which notes: *“A dependency is likely to occur where a development will breach ‘a reasonable level of service’ on the transport network.”*

2.74 As noted in TAG Unit A2.1, Wider Economic Impacts Appraisal, Table 2 (May 2019), the Level 1 assessment of transport user benefits exclude Dependent Development from the traffic forecasts. As such, the ‘Non-Dependent’ traffic forecasts exclude the impacts of dependent development and have been used to assess the transport user benefits of the scheme.

2.75 Additional Induced Investment benefits associated with the change in land value arising from the associated change in land use accrued as part of the scheme in relation to the Thoresby Colliery and Teal Close sites are presented in Section 10.

2.76 Noting that dependent development should not be included in the assessment of transport user benefits, a forecast scenario *including* the trips associated with the dependent development sites has been produced for the purposes of junction design. This forecast has only been used to ensure the proposed junction designs have sufficient capacity and is not used in the assessment of transport user benefits.

2.77 Junction modelling of Ollerton and Lowdham using the dependent development forecast demands demonstrate that the proposed improvements provide sufficient capacity to accommodate the dependent development and meets the planning conditions allow the full developments to go ahead. This is shown in Table 2.18 below which show the RFC of the improved junctions forecast to operate within capacity, or approaching capacity, in the scheme design year.

**Table 2.18: Dependent Development Junction Modelling – 2037 Design Year**

2037 Design Year – Dependent Development						
	Lowdham Do Something			Ollerton - Do Something		
	Max Queue (PCU)	RFC	Junction Delay (s)	Max Queue (PCU)	RFC	Junction Delay (s)
AM	16.5	0.96	30.55	5.9	0.85	11.33
PM	30.2	1.00	29.51	8.2	0.9	15.45
IP	1.3	0.57	4.24	1.5	0.61	4.58
OP	0.1	0.05	1.86	0.1	0.05	1.96

## Core Traffic Forecast Methodology

- 2.78 Data on future trip generation and traffic distribution was taken wherever possible directly from the Transport Assessments supporting the various planning applications.
- 2.79 Trip distribution data was not available for the Kirklington Road, Oldbridge Way and Gedling Colliery developments.
- 2.80 To calculate trip distribution for Gedling Colliery, the gravity model contained within the Calverton Transport Assessment was used, given the similar nature and location of the two developments. The gravity model used within the Calverton Transport Assessment was developed by RPS Group plc and approved by Nottinghamshire County Council as part of the planning application process. The model calculates attraction to key destinations (as a percentage) as a function of employment population and distance to the key destination. Trips are then assigned to the network using an online route planner to determine the most likely routes travellers would use to travel to the key destination. The Calverton Transport Assessment gravity model is shown in Figure 2.12.

**Figure 2-12: Calverton Gravity model (used to estimate trip generation at Gedling Colliery) – produced by RPS Group plc**

Transport Assessment

Settlement	Employment Population (P)	Distance		P/D <sup>2</sup>	%
		km	Miles (D)		
Calverton	2,333	3	1.865	671.095	6.94%
Newark On Trent	21,144	29	18.024	65.088	0.67%
Grantham	20,958	40	24.860	33.911	0.35%
Nottingham	332,733	11	6.837	7119.059	73.61%
Mansfield	80,065	13	8.080	1226.502	12.68%
Derby	129,129	35	21.753	272.898	2.82%
Loughborough	37,425	48	29.832	42.052	0.43%
Lincoln	68,474	59	36.669	50.925	0.53%
Leicester	246,503	58	36.047	189.705	1.96%
				<u>9671.236</u>	

- 2.81 To calculate trip distribution for the Kirklington Road and Oldbridge Way developments, the 2011 Journey to Work census has been used which shows the volume and destination of inflows and outflows to the Newark and Sherwood District Council area. A route planner was then used to determine the most likely routes used by traffic to get to / from these points. The 2011 Journey to Work census data, whilst being 8 years old, is considered the most suitable source of data for traffic distribution since it presents the most extensive database on trip origins and destinations to date.
- 2.82 The trip distributions for the AM and PM inflow and outflow (derived from 2011 Journey to Work census data) is shown in Table 2.19.

**Table 2.19: Trip distribution calculated from 2011 Journey to Work census data – applied to Kirklington Road and Oldbridge Way**

Key Origin / Destination	Inflow	Outflow
Nottingham	8.2%	21.7%
Mansfield	25.4%	19.5%
Ashfield	7.3%	11.0%
Bassetlaw	10.5%	10.7%
Gedling	10.0%	9.2%
Rushcliffe	7.0%	6.9%
South Kesteven	7.9%	6.7%
Lincoln	10.1%	6.0%
North Kesteven	9.5%	5.7%
Bolsover	4.0%	2.6%

- 2.83 For any developments where trip distribution data was not available along the full length of the A614/A6097 corridor, traffic has been assigned along the remainder of the corridor using the observed turning movement proportions from the MCCs at each junction.

- 2.84 For each junction approach arm the percentage of total vehicles (in PCUs) making each turning movement is calculated (for example on Mickledale Lane in the AM Peak, 22% of traffic routes right (to A614 (N)) and 78% routes left (to A614 (S)). When development traffic reaches each junction, it is routed according to the baseline turning movement proportions. For example, should 100 vehicles be travelling along Mickledale Lane from the Oldbridge Way development, 22 are expected to route right and 78 left. The resulting traffic volume is then routed according to the MCC turning proportions at each junction until the end of the corridor. Appendix J shows the distribution of traffic for each development site along the A614 – A6097 corridor by time period.
- 2.85 For clarity, Table 2.20 summarises the source of trip generation and traffic distribution data for each development site by time period respectively.

**Table 2.20: Trip generation and traffic distribution data source for each proposed development**

Development	Trip Generation data source	Trip distribution data source	Trip distribution along corridor
Petersmith Drive	Taken from TA (February 2017)	Taken from TA (February 2017)	Partial distribution data along A614 – A6097 corridor. Remainder has been assigned according to MCC turning movement proportions.
Thoresby Colliery	Taken from TA (December 2016)	Taken from TA (December 2016)	Partial distribution data along A614 – A6097 corridor. Remainder has been assigned according to MCC turning movement proportions.
Eakring Road	Taken from TA (June 2017)	Taken from TA (June 2017)	Partial distribution data along A614 – A6097 corridor. Remainder has been assigned according to MCC turning movement proportions.
Kirklington Road	Taken from TA (May 2018)	Calculated via 2011 census data to identify key destinations and percentage of trips routing to these. Assigned using an online route planner. (Calculated for this study by AECOM)	Distribution along A614 – A6097 corridor identified through census data / route planner.
Oldbridge Way	Taken from TA (October 2016)	Calculated via 2011 census data to identify key destinations and percentage of trips routing to these. Assigned using an online route planner. (Calculated for this study by AECOM)	Distribution along A614 – A6097 corridor identified through census data / route planner.
Bingham	Taken from TA (October 2010)	Taken from TA (October 2010)	Partial distribution data along A614 – A6097 corridor. Remainder has been assigned according to MCC turning movement proportions.
RAF Newton	Taken from TA (December 2010)	Taken from TA (December 2010)	Partial distribution data along A614 – A6097 corridor. Remainder has been assigned according to MCC turning movement proportions.
Calverton	Taken from TA (May 2018)	Taken from TA (May 2018)	Partial distribution data along A614 – A6097 corridor.

			Remainder has been assigned according to MCC turning movement proportions.
Teal Close	Taken from TA (April 2013)	Taken from TA (April 2013)	Partial distribution data along A614 – A6097 corridor. Remainder has been assigned according to MCC turning movement proportions.
Gedling Colliery	Taken from TA (December 2015)	Gravity model contained within the Calverton Transport Assessment used to assign development trips (due to the similar location and nature of the two sites).	Partial distribution data along A614 – A6097 corridor based upon Calverton Gravity Model. Remainder has been assigned according to MCC turning movement proportions.

- 2.86 The transport assessments identified have all presented their development trip generations as total vehicles rather than by vehicle type. For this purpose, the A614/A6097 forecasts have been developed as a total vehicle forecast then converted to PCU's by applying observed HGV proportions along the corridor. This approach reflects the volumetric increase in HGVs but retains the observed proportions.
- 2.87 Only AM and PM trip generation were provided in the Transport Assessments, and as such it was necessary to calculate the IP and OP values.
- 2.88 To calculate the IP trip generation, the Trip Rate Information Computer System (TRICS) was used to generate trip rates for the following land uses associated with the committed developments:
- Residential
  - B1 (Office)
  - B2 (Industrial Estate)
  - B8 (Commercial Warehousing)
  - Drive Thru
  - Pub / Restaurant
- 2.89 Average arrival / departure trip rates were extracted from TRICs version 7.5.3. Sites within Greater London and Ireland were excluded from the database due to a large number of Public Transport users within Greater London and a heavy reliance upon private vehicles in Ireland. The TRICS output data is available in Appendix K.
- 2.90 The hourly trip rate was extracted for each land use, and an average AM, PM and IP trip rate calculated. The IP ratio was calculated as follows, with the resulting IP trip rate ratios provided in Table 2.21.

$$\text{IP ratio} = \text{IP trip generation rate} / (\text{AM trip generation rate} + \text{PM trip generation rate})$$

**Table 2.21: Inter Peak ratio for each land-use type**

	Arrivals	Departures
Residential	0.368939	0.308237
B1	0.174709	0.210784
B2	0.492047	0.463687
B8	0.438953	0.457143
<b>Employment average</b>	<b>0.36857</b>	<b>0.377205</b>
Drive Thru	0.539977	0.561618
Pub / Restaurant	0.462056	0.440971

2.91 The IP ratios were then applied to the AM and PM trip generation values at each development, for each land use type respectively. Where the employment split had not yet been defined for commercial developments, the employment average IP ratio was used.

2.92 Due to the absence of data on the TRICS database for the Off-Peak period, permanent count sites along the A614 / A6097 (aforementioned and shown in Figure 2-1) were used to calculate an OP factor. Using the average weekday hourly flow, an average Inter Peak flow and Off Peak flow was generated. From this, an Off Peak ratio was calculated as follows, with resulting outputs shown in Table 2.22.

$$\text{OP ratio} = \text{Off Peak average flow} / \text{Inter Peak average flow}$$

**Table 2.22: Off Peak Ratio**

Permanent Count Site Location	Interpeak Average	Off Peak Average	OP Ratio
Bilsthorpe (N)	1273	141	0.1108
Bilsthorpe (S)	1327	136	0.1025
Warren Hill (S)	450	46	0.1025
Lowdham (N)	1072	94	0.0880
Lowdham (S)	1495	127	0.0849
<b>Average</b>			<b>0.0978</b>

2.93 The OP factor was then applied to the IP trip generation values to determine the trip generation from each development.

2.94 To identify the level of development in the 2023 Opening Year, the percentage built out at each development was calculated, based upon the Local Plan publication housing trajectory supplied by NCC. This is shown in Appendix L. Table 2.23 shows the cumulative and percentage built out for each development for the 2023 Opening Year.

**Table 2.23: Build Out Rate**

Development	Cumulative Build Out	Percentage Build out (%)
	2023	2023
Petersmith Drive	200	66%
Thoresby Colliery	150	100%

Eakring Road	85	100%
Kirklington Road	100	74%
Oldbridge Way	113	100%
Bingham	450	45%
RAF Newton	300	60%
Calverton	390	60%
Teal Close	240	74%
Gedling Colliery	240	23%

- 2.95 The percentage build out rates for each development have then been applied to the Development Flows at each development, to yield the development flows in 2023.
- 2.96 Appendix M shows the traffic flows associated with the identified development in the AM, PM, IP and OP time periods, considering dependent and non-dependent development forecasting scenarios respectively. Also provided in Appendix J are site specific flow diagrams are included to illustrate the trip generations and distributions associated with each development site.
- 2.97 To account for any additional future growth, the NTEM database was used to calculate 'topping up' factors that were applied estimate future year Opening Year and Design Flows.
- 2.98 NTEM is a database developed by the Department for Transport (DfT) as part of the National Transport Model (NTM). The NTEM database can be interrogated to find the forecast year trip-end growth projections for travel including by car, thus allowing local area traffic models to be developed on a consistent basis with regards to future year national growth.
- 2.99 The forecast outputs from NTEM for a specific area are based upon National Planning Policy aspirations regarding future employment and housing levels that have been input to the NTM.

2.100 Forecast outputs from NTEM are extracted from the flowing districts:

- E02005848 – Bassetlaw 014
- E02005893 – Newark and Sherwood 001
- E02005894 – Newark and Sherwood 002
- E02005897 – Newark and Sherwood 005
- E02005866 – Gedling 002
- E02005905 – Newark and Sherwood 013
- E02005908 – Rushcliffe 003

2.101 Figure 2-13 identifies these NTEM districts.

Figure 2-13: NTEM Growth Factor districts

2.102 The NTEM rate from each individual district was combined into an average growth rate for the A614/A6097 corridor in each time period, as shown in Table 2.24.

2.103 The growth in vehicle numbers expected from committed development along the A614 / A6097 corridor relative to the baseline is shown in Table 2.25 for each forecast scenario. This 'Development Growth' considers the expected increase in vehicle numbers from the baseline attributed to the proposed development only (i.e. it does not consider any likely background growth associated with population growth etc).

2.104 Subtracting the NTEM growth from the expected development growth shows the time periods where expected growth from development is lower than NTEM growth (highlighted in bold in Table 2.26). In this instance, the traffic flows in each scenario have been 'topped up' to NTEM levels in order capture all expected growth in traffic flow across the network.

2.105 For the purposes of economic assessment, 'topping up' has been excluded in the Design Year as the Dependent Development growth (excluded from the economic assessment) will account for the shortfall between Committed Development and NTEM levels in the Design Year in the AM and IP periods.

2.106 In the PM peak, the 'with dependent development' forecast is slightly below NTEM forecast growth. No additional NTEM growth has been applied to the PM 'non-dependent' forecast on the assumption that this is a robust approach for economic appraisal (future year PM Do Minimum delays may be slightly underestimated). The 'with dependent development' forecast has been topped up to NTEM growth forecasts to ensure the proposed design contains sufficient capacity for additional growth elsewhere in the district.

2.107 As such, the 2023 Opening Year PM scenario and 2037 Dependent PM scenario have had a 'topping up' factor applied.

**Table 2.24: NTEM Growth**

	AM	PM	IP
Opening Year (2023)	8.2%	9.2%	8.1%
Non-Dependent Growth (2037)	22.1%	24.8%	21.9%
Dependent Growth (2037)	22.1%	24.8%	21.9%

**Table 2.25: Development Growth**

	AM	PM	IP
Opening Year (2023)	9.5%	8.4%	8.8%
Non-Dependent Growth (2037)	13.5%	11.8%	12.4%
Dependent Growth (2037)	25.5%	23.1%	23.8%

**Table 2.26: Topping Up factor (NTEM Growth – Development Growth)**

	AM	PM	IP
Opening Year (2023)	-	<b>0.8%</b>	-
Non-Dependent Growth (2037)	-	-	-
Dependent Growth (2037)	-	<b>1.7%</b>	-

2.108 It is noted that the NTEM forecasts represent the predicted car growth in the region, whereas the A614 forecasts have been produced at an all vehicle level (for the reasons set out in paragraph 2.75). As the expected development growth (non-dependent and dependent) has not been constrained to NTEM and in all but one case exceeds NTEM growth, the comparison is useful. In the cases where forecasts are below NTEM and have not had a 'topping up' factor applied, forecast could be an underestimation of demand. This is a robust approach for economic appraisal (future year PM Do Minimum delays may be slightly underestimated).

### Ollerton Reassignment

2.109 It was noted that the improvements to Ollerton roundabout had a small potential for possible reassignment of local traffic likely currently routing through the village to avoid journey time delays at peak times. An assessment of through traffic was identified in a Nottinghamshire County Council analysis of matched registration survey conducted in 2017. This assessment was used to make allowance for potential reassignment onto the A614 corridor in the Do Something scenario for use in the Noise & Air Quality assessment.

2.110 The 2023 Opening Year traffic forecasts, used within the Economic Assessment are shown in Appendix N.

2.111 The 2037 Design Year traffic forecasts, used within the Economic Assessment, are contained within Appendix O.

### Traffic Forecast Summary

2.112 Table 2.27 to Table 2.32 provide a summary of how peak hour demand at the scheme junctions are forecast to grow in future.

**Table 2.27: Ollerton Junction**

	Time period	Total Junction Inflow (pcu/hr)
Base Year (2018)	AM	2,866
	PM	2,950
Opening Year (2023)	AM	3,210
	PM	3,138
Design Year (2037)	AM	3,223
	PM	3,253

**Table 2.28: Deerdale Lane Junction**

	Time period	Total Junction Inflow (pcu/hr)
Base Year (2018)	AM	1,965
	PM	1,896
Opening Year (2023)	AM	21,36
	PM	1,393
Design Year (2037)	AM	2,210
	PM	2,092

**Table 2.29: Mickledale Lane Junction**

	Time period	Total Junction Inflow (pcu/hr)
Base Year (2018)	AM	2,018
	PM	2,023
Opening Year (2023)	AM	2,204
	PM	2,226
Design Year (2037)	AM	2,281
	PM	2,262

**Table 2.30: White Post Junction**

	Time period	Total Junction Inflow (pcu/hr)
Base Year (2018)	AM	2,410
	PM	2,321
Opening Year (2023)	AM	2,663
	PM	2,566
Design Year (2037)	AM	2,760
	PM	2,628

**Table 2.31: Warren Hill**

	Time period	Total Junction Inflow (pcu/hr)
Base Year (2018)	AM	2,034
	PM	1,821
Opening Year (2023)	AM	2,276
	PM	2,050
Design Year (2037)	AM	2,372
	PM	2,116

**Table 2.32: Lowdham Junction**

	Time period	Total Junction Inflow (pcu/hr)
Base Year (2018)	AM	3,424
	PM	3,485
Opening Year (2023)	AM	3,651
	PM	3,712
Design Year (2037)	AM	3,807
	PM	3,820

**Table 2.33: Kirk Hill Junction**

	Time period	Total Junction Inflow (pcu/hr)
Base Year (2018)	AM	2,800
	PM	2,250
Opening Year (2023)	AM	2,695
	PM	3,200
Design Year (2037)	AM	2,929
	PM	3,303

2.113 Table 2.34 to Table 2.25 below present the total volumes for each approach at each junction in both the opening year and design year. Further detail is also provided in Appendix P which present the opening year and design year turning matrices by time period.

Table 2.34: Ollerton – Inflow by approach arm (pcu/hr)

2.114 The total inflows presented in Table 2.21 to Table 2.5 were reviewed against base year movements and local knowledge of the junctions and appear logical and were considered suitable for use in scheme appraisal.

**Annual Average Daily Traffic (AADT)**

2.115 Network AADT values were computed via a factor calculated using long term permanent ATC data along the A614/A6097 corridor. The ATC sites provide hourly flow, by direction for every day of the year. Five count sites that had a full year (2018) available were used in the assessment (Figure 2.1):

- A614 Bilsthorpe (N) – Site ID: 000030306363
- A614 Bilsthorpe (S) – Site ID: 000030306359
- A6097 Warren Hill (S) – Site ID: 0000352206253
- A6097 Lowdham (N) – Site ID: 000030806547
- A6097 Lowdham (S) – Site ID: 000030006745

- 2.116 The average daily (24hr) traffic was derived from the long-term data across the 5 count sites that had a full year (2018) available. In addition, the average weekday AM, Inter-peak and PM peak hours were derived
- 2.117 The relationship between the observed average daily flow and observed average weekday peak hours was used to produce a factor that could be applied to the A614/A6097 traffic forecast to produce an Annual Average Daily Traffic volumes. The average two-way 24 hour flow was divided by the sum of the average weekday Peak Hours (AM, PM, IP and OP) to calculate an AADT factor, as shown below:

$$\text{AADT Factor} = \text{Average 24 hour flow} / (\text{Average Weekday AM Peak flow} + \text{Average Weekday PM Peak flow} + \text{Average Weekday IP Peak flow} + \text{Average Weekday OP Peak flow})$$

$$\text{AADT Factor} = 3.876$$

- 2.118 To calculate the forecast AADT flows on the A614 / A6097 network, the sum of the AM, PM, IP and OP peak periods forecasts was multiplied by the AADT Factor (3.876). A worked example is presented in Appendix Q.
- 2.119 The resulting AADT flows are shown in Appendix R. These values were subsequently used in the COBALT analysis.

## National Economic Uncertainty

- 2.120 Traffic demand is driven not only by demographic changes such as an increase in population, but also by GDP growth and fuel price, both of which affect the utility for travel. Models that rely on NTEM will not fully reflect the uncertainty of these national trends.
- 2.121 To account for this, the DfT's TAG Unit M4 (May 2019) at section 4 recommends that a proportion of the model's base year matrix, on a cell-by-cell basis, is either added (High Growth) or subtracted (Low Growth) from the CS Reference case matrix. This proportion is defined as 2.5% multiplied by the square root of the number of years between the base year and the forecast year.
- 2.122 Table 2.41 shows the proportions of the base matrices that were added or subtracted from the CS Reference Case matrices on a cell-by-cell basis.

**Table 2.41: High/Low Growth Scenario Proportions**

Base	Forecast year	Base to Forecast year.	Square Root of forecast year.	High	Low
2018	2023	5	2.27	+5.590%	-5.590%
2018	2037	19	4.36	+10.900%	-10.900%

## Local Uncertainty

- 2.123 In addition to National Uncertainty, there is also uncertainty in Local Planning assumptions. There is uncertainty that the number of development proposals under a High Growth Scenario would increase and under a Low Growth Scenario would decrease. Both the demand and supply can be combined in the context of local uncertainty.
- 2.124 To account for local uncertainty both a low development scenario and high development scenario were produced.

## The High Alternative Growth Scenario

- 2.125 Some developments may be more likely to be delivered under a high growth development scenario. Of the potential developments identified in the corridor (paragraph 2.64 and Table 2.17), all were considered to be “Near Certain” or “More than Likely”. Therefore no additional local development assumptions were incorporated into the High Growth Scenario.
- 2.126 The High Growth Scenario should incorporate highway improvements that are considered to be optimistic. There are no additional highway scheme along the corridor that would impact the forecasts
- 2.127 Presented in Table 2.42 to Table 2.48 are the total volumes for each approach at each junction in both the opening year and design year under a high growth scenario.

## The Low Alternative Growth Scenario

- 2.128 This scenario represents the utility of travel under a low economic growth outcome.
- 2.129 TAG Unit M4, paragraph 4.2.8 notes that in the low growth scenario, excluding some of the less likely sources of growth that were included in the core scenario may be appropriate. Given the potential developments identified in the corridor (paragraph 2.64 and Table 2.17), all were considered to be “Near Certain” or “More than Likely”, the local development assumptions in the Low Growth Scenario remain the same as the Core Scenario.
- 2.130 The supply network under this Low Growth Scenario is unchanged from the Core Scenario in accordance with TAG Unit M4, paragraph 4.2.10.
- 2.131 The supply network under this Low Growth Scenario is unchanged from the Core Scenario in accordance with TAG Unit M4, paragraph 4.2.10.
- 2.132 Table 2.49 to Table 2.55 below present the total volumes for each approach at each junction in both the opening year and design year under a Low Growth Scenario.

## Junction Modelling

- 2.133 Computer models of the existing junction layouts and proposed schemes have been prepared by Nottinghamshire County Council's delivery partner, VIA East Midlands Ltd. ARCADY has been used to assess the capacity of roundabout junctions; PICADY has been used to assess the capacity of priority junctions (T-junctions and crossroads); and LINSIG has been used to assess the highway capacity of signalised junctions.
- 2.134 In the base models, the geometry required by the J9 models (ARCADY for roundabouts and PICADY for priority junctions) was measured from OS survey base drawings.
- 2.135 Queue surveys were carried out at the Ollerton and Lowdham roundabouts and at Deerdale Lane and the survey data used to validate the existing ARCADY and PICADY models for these junctions.
- 2.136 The results of the modelling for the opening year scenarios in the AM and PM peaks for the 2 roundabouts match within reasonable tolerance with the observed queue lengths. Notable observations include:

**Ollerton:** The Ollerton queue surveys demonstrate that the critical approaches in the AM were the A614 south and A616W, with consistent queues over a sustained period of time. The A614N approach was shown to queue extensively at times also, however, this was for shorter periods and fluctuated up (and back down) throughout the period. Consequently, the approaches which were critically assessed for queue length fit were the A614S (arm 2) and A616W (arm 4) approaches and the model fits this pattern. In the PM peak the critical approach is the A614S and, again, the model fits the observed queue lengths satisfactorily. The one difference is the queues on the A616W which were observed to be higher during a substantial part of the peak when compared to the model. This may be explained in part by the comment in the queue length survey regarding a Road Traffic Accident at the junction.

**Lowdham:** The queue survey shows the A612E approach to be the most under stress in the AM peak followed by the A6097N. This is mirrored in the Arcady model for the A612E. The A6097N shows lower queueing than noted on site, however, there was an element of exit blocking on the A6097 heading towards the river which may have affected the observed queues which could not be modelled in the isolated Arcady model. In the PM peak the predominant queue is on the A612W. The observed queues extended beyond the survey section for a substantial period of time. This behaviour is reflected in the model. The A6097S is the next worst performing arm and this is again reflected in the model.

**Deerdale:** The queue and delay surveys show the build up and discharge of vehicles for the movements which are required to give-way currently. In the AM peak the queueing is generally low, apart from the occasional build-up, the worst of which began at 07:31:32 where 10 vehicles were noted with the queue fully discharging after 6 minutes 41 seconds. The next peak appeared at 08:12:01 with a total discharge time of 2 minutes and 1 second; and a third occurrence at 08:34:10 where the full discharge time from the first vehicle appearing at the junction and the last discharging was 2 minutes 48 seconds. Other than these three occurrences the wait time at the give way line was minimal. For the right turn into Deerdale Lane, the wait time throughout the peak was minimal. In the PM peak there were only two periods of significant side road delay occurring at 17:01:20 and 17:17:56. Other than these two periods the side road performance was generally good with low levels of vehicle delays. Again, for the right turn in the delays were minimal. Given these low levels of queue overall, the model was not calibrated beyond ensuring that the geometric data used in the Picady model was correctly interpreted.

- 2.137 Input flow profiles were left at the default for the individual modelling programs and input flow data was based on PCU's. In all cases the modelling matched existing and therefore it is considered the tolerances stated within the TEAR are acceptable.
- 2.138 The above software produces outputs in terms of overall vehicle delay, and this is the main output that has been used in the Transport Economic Efficiency (TEE) calculations contained in this report.

2.139 Table 2.56 shows the software used for each junction and provides references to the relevant Appendix within which a scheme drawing and the full results are contained. The optioneering process to develop the schemedesigns in reported in the A614/A6097 Major Road Network Improvement Scheme, Options Appraisal Report (60595614/OAR, December 2020).

2.140 The scheme at White Post is a road safety scheme involving anti-skid road surfacing and minor maintenance improvements. Warren Hill is a minor geometric alteration. Neither provide measurable capacity improvements and have not been appraised, though the scheme costs are reflected in the value for money analysis.

**Table 2.56: Junction Layouts and Software Used to Assess Delay**

Junction	Existing Layout	Proposed Layout	Appendix
Ollerton	Roundabout (ARCADY)	Roundabout (ARCADY)	Appendix S
Deerdale	Crossroads (PICADY)	Signals (LINSIG)	Appendix T
Mickledale Lane	Crossroads (PICADY)	Signals (LINSIG)	Appendix U
White Post	Not Assessed	Not Assessed	N/A
Warren Hill	Not Assessed	Not Assessed	N/A
Lowdham	Roundabout (ARCADY)	Roundabout (ARCADY)	Appendix V
Kirk Hill	Signals (LINSIG)	Signals (LINSIG)	Appendix W

2.141 Table 2.57 to Table 2.61 summarise the modelling outputs at each scheme junction. The worst performing arm is shown in each instance, with the exception of Junction Delays which presents the combined delays across all arms of the junction

2.142 Ollerton roundabout is noted to be overcapacity (with a Ratio to Flow Capacity (RFC) value of over 1.0) in the AM and PM Peak periods in the baseline scenario, whilst Lowdham is overcapacity in the PM Peak period. Warren Hill and White Post are noted to approaching capacity (RFC value of over 0.85% in the baseline).

2.143 For existing junctions, RFC values above 0.85 are likely to produce queues which increase slowly. Above an RFC value of 1.0, a junction is more than likely to be at capacity (with resulting larger increases in queue length).

2.144 Presented in Table 2.57 to Table 2.61 are the volume to capacity ratio (RFC) for the worst performing arm of each junction, indicating where there is overcapacity (where the ratio flow to capacity value is over 1.0). A comparison of the RFC values between the Do Minimum and Do something values shows that with improvement all the junctions work within capacity (below RFC of 1.0) in the forecast year of 2037.

2.145 The scheme improvements, whilst providing localised capacity improvements, are not expected to materially impact the Strategic Road Network (SRN). The A46 (accessed from the A46/A6097 Saxondale grade separated junction) is 3.3 miles south of Lowdham Roundabout at the southern end of the A614 – A6097 corridor). To the north the A1 is 6.7miles north of the Ollerton roundabout. The limited route choice along the A614-A6097 corridor has supported a fixed trip appraisal methodology which assumes that no trips reassign into the corridor as a result of the scheme. This is supported by the strategic model testing using the MCHM which has demonstrated that reassignment and VDM impacts resulting from the scheme is not material.

## 3. Economic Appraisal Methodology

### Value for Money

- 3.1 Value for money' is one of the key considerations of any decision involving the use of public funds across government. It is considered in the Economic Case of the 'Five Case Model' of decision-making recommended in the 'Green Book' methodology by Her Majesty's Treasury (HMT) and adopted by the Department for Transport (DfT) in the "Transport Business Case".
- 3.2 The DfT's approach to assessing and reporting a value for money case is detailed in the document "Value for Money Framework", (DfT, 2017).
- 3.3 This document notes that some methods for identifying outcomes, impacts and estimating their monetary values are more widely accepted than others, as they are well-researched, tried-and-tested, and robust. To reflect this in a way which is useful for decision-making, the DfT distinguishes between three 'types' of monetised impacts: established, evolving, and indicative monetised impacts. These are treated differently in the value for money assessment and presented separately in Value for Money Statements.
- 3.4 Table 3.1 below summaries the typical impacts of a transport scheme as set out in Box 4.4 of the Value for Money Framework document.

**Table 3.1: Typical impacts of a Transport Scheme (DfT VfM Framework, 2017)**

<b>Established Monetised Impacts</b>	<b>Evolving Monetised Impacts</b>	<b>Indicative Monetised Impacts</b>	<b>Non-monetised Impacts</b>
<i>Included in initial and adjusted metrics</i>	<i>Included in adjusted metrics</i>	<i>Considered after metric using switching values approach</i>	
Journey time savings	Reliability	Moves to more/less productive jobs	Security
Vehicle operating costs	Static clustering	Induced Investment	Severance
Accidents	Output in imperfectly competitive markets	Supplementary Economy Modelling	Accessibility
Physical Activity	Labour Supply		Townscape
Journey Quality			Historic Environment
Noise			Landscape
Air Quality			Biodiversity
Greenhouse Gases			Water environment
Indirect Tax			Affordability
			Access to services
			Option and non-use values

- 3.5 This document describes the approach and appraisal results of the established monetised impacts:
- Journey time savings
  - Vehicle operating costs
  - Accidents
  - Noise
  - Air Quality
  - Greenhouse Gases (Carbon)
  - Indirect Tax
- 3.6 This EAP document also describes the approach and appraisal results of the following indicative monetised impacts:
- Induced Investment
    - Land Value Uplift associated with dependent development; and
    - The Transport External Costs associated with dependent development.
    - Land Amenity Value

## Scheme Costs

- 3.7 Via East Midlands has provided estimates of the costs of delivering the six junctions within the scheme. These costs have also been reviewed by a contractor selected from the council’s MHA framework.
- 3.8 Table 3.2 shows the anticipated construction start dates, and opening year of each of the junctions.

**Table 3.2: Construction Start Dates and Opening Years**

Junction	Construction Start Date	Opening Year
Ollerton	Sep-22	May-24
Mickledale	Mar-25	Dec-25
White Post	Jan-25	Jan-25
Warren Hill	Aug-25	Aug-25
Lowdham	Jun-24	Dec-24
Kirk Hill	Apr-23	Dec-23

- 3.9 Scheme estimates were provided in 2020 Q1 prices including a 15% investment cost optimism bias. The following items are included in the cost estimate:
- Construction Costs;
  - Preparation;
  - Supervision Costs; and
  - Land,
- 3.10 The cost proforma summary, which includes an assessment of cost inflation, is presented in Appendix X.

3.11 Table 3.3 to Table 3.8 show the anticipated expenditure profiles for each of the junctions.

**Table 3.3: Expenditure Profile (2020 Prices) - Ollerton**

3.12 Table 3.10 below presents a summary of the cost estimates at each junction.

**Table 3.10: Scheme Costs Estimates (2020 prices)**

	Construction	Preparation	Land	Supervision	Total
Ollerton Roundabout	£10,802,822	£606,737	£528,961	£365,984	<b>£12,304,503</b>
Lowdham Roundabout	£6,862,187	£299,000	£146,285	£78,484	<b>£7,385,956</b>
Warren Hill	£278,156	£0	£28,750	£0	<b>£306,906</b>
Mickledale Lane	£6,126,770	£287,500	£234,940	£57,500	<b>£6,706,710</b>
Deerdale Lane	£10,166,915	£172,500	£250,341	£230,000	<b>£10,819,757</b>
White Post Roundabout	£309,063	£0	£0	£0	<b>£309,063</b>
Kirk Hill	£5,332,959	£218,500	£287,500	£78,484	<b>£5,917,443</b>
<b>Total</b>	<b>£39,878,872</b>	<b>£1,584,237</b>	<b>£1,476,777</b>	<b>£810,452</b>	<b>£43,750,338</b>

3.13 As part of the scheme design development, the updated cost estimates at Deerdale Lane junction has increased by £5.83m (excluding optimism bias) following the return of significant utility diversion cost estimates in October 2020. This, along with updated cost estimates for the other junctions results in a package cost estimate of £43.75m. This has resulted in a package that is not affordable. Given the large increase in cost, and the previous poor value for money case of the junction in isolation, the Deerdale Lane improvement has been removed from the package of measures. No further analysis of Deerdale Lane is presented.

**Table 3.11: Scheme Costs Estimates (2020 prices) – Excluding Deerdale**

	Construction	Preparation	Land	Supervision	Total
Ollerton Roundabout	£10,802,822	£606,737	£528,961	£365,984	<b>£12,304,503</b>
Lowdham Roundabout	£6,862,187	£299,000	£146,285	£78,484	<b>£7,385,956</b>
Warren Hill	£278,156	£0	£28,750	£0	<b>£306,906</b>
Mickledale Lane	£6,126,770	£287,500	£234,940	£57,500	<b>£6,706,710</b>
White Post Roundabout	£309,063	£0	£0	£0	<b>£309,063</b>
Kirk Hill	£5,332,959	£218,500	£287,500	£78,484	<b>£5,917,443</b>
<b>Total</b>	<b>£29,711,957</b>	<b>£1,411,737</b>	<b>£1,226,436</b>	<b>£580,452</b>	<b>£32,930,581</b>

- 3.14 The latest cost estimate for the package of measures is currently £32.94 million. The project requires a total contribution of £24.340 million from the DfT, with the remaining sum being funded by S106 contributions, Community Infrastructure Levy and County Council capital contributions. Section 106 contributions from developers including the promoter of the Thoresby Colliery redevelopment site at Edwinstowe (Harworth Group Plc) has paid a S106 contribution of £1.198 million. The total value from S106 contributions comes to £1.746 million (including Harworth Group S106 contribution).
- 3.15 Discussions are ongoing with developers and district council partners regarding possible developer and Community Infrastructure Levy contributions to help meet the 15% local financial contribution ie any costs over and above the requested DfT contribution. Harworth Group Plc (the promoter of the Thoresby Colliery redevelopment site at Edwinstowe) for example has already paid a financial contribution of £1.198m. This contribution is based on an agreed proportion of the cost of the Ollerton roundabout element of the improvement package. All future developer contributions would be index linked. Nottinghamshire County Council has agreed to underwrite any shortfall in local funding in order to deliver the local contribution in full towards the proposed package of works.
- 3.16 The funding of the scheme is a combination of various financial contributions, including a maximum contribution of £24.34m from DfT with the remainder from S106 / CIL / Nottinghamshire County Council capital contributions.
- 3.17 The supplied expenditure profiles were calculated based upon cost estimates for each financial year prepared in 2020 Q1 prices including a 15% investment cost optimism bias and then inflated to outturn costs, using projected construction related inflation. These costs were then rebased to 2010 prices – all costs were in the factor cost units of account (sometimes referred to as resource costs). The costs were allocated to the calendar years of expenditure. Cost incurred in 2020 are considered historic and have been removed from the Present Value Cost (PVC) calculation.
- 3.18 The Present Value of Cost (PVC) in 2010 market prices, discounted to a 2010 present value year, has been calculated as:
- Ollerton: £6,806,000
  - Mickledale Lane: £4,333,000
  - White Post: £184,000
  - Warren Hill: £196,000
  - Lowdham: £4,242,000
  - Kirk Hill: £3,444,000
  - **Total: £19,205,000**

## TUBA Assessment

- 3.19 The economic appraisal of the new scheme proposals was carried out using the DfT's TUBA software (Version 1.9.14).
- 3.20 This assessment uses 'economics\_TAG\_db1\_9\_13\_1.txt' as the Economics Parameters file. While this is the most up to date economics file available, it must be noted this is based upon WebTAG Data Book (v1.13.1) July 2020 release.
- 3.21 The economic appraisal has been calculated for 60 years, as required by the DfT (TAG, Unit 3.5.4). The appraisal period was from 2023 to 2082. The opening years of the six junctions do not occur in a single year (see Table 3.2) although for the purposes of the TUBA assessment a common opening year of 2023 was used.
- 3.22 A discount rate of 3.5% for the first 30 years of appraisal and 3.0% for the second 30 years of appraisal has been used. All monetary values set down in this report are in 2010 market price units of accounting, discounted to 2010.
- 3.23 The delay in seconds from the junction model outputs was converted into hours and input into the TUBA model. The distance used nominal values (0.5km) because the approach speeds for the Do Minimum and Do Something scenarios, are assumed not change. The distance element of the calculation only affects VOC and Greenhouse Gas changes, which as discussed below, are not included in this assessment.
- 3.24 Table 3.12 to Table 3.14 show the split of vehicle types used based on the manual classified counts described in Sections 2.10 – 2.17 for each junction respectively.
- 3.25 Due to the absence of MCC count data in the Off Peak, the vehicle splits from the IP scenario have been taken to represent the likely vehicle splits in the OP period.
- 3.26 The TUBA input and full output data is available within the following appendices:
- Ollerton – Appendix Y
  - Mickledale Lane – Appendix Z
  - Lowdham – Appendix AA
  - Kirk Hill – Appendix BB

**Table 3.12: Vehicle type by period (%) for Ollerton**

3.27 Journey Purpose splits for work and non-work, detailed in Table A 1.3.4 from the July 2020 release of the WebTAG Databook (v1.13.1) was applied to Table 3.12 to Table 3.14 in order to split observed vehicle type proportions into TUBA User Classes. The results of this process are shown in Table 3.16 to Table 3.18 which lists the split of total vehicles into each relevant User Class by time period.

3.28 These factors were applied to the total demand flow matrices via the TUBA input files.

### Annualisation

- 3.29 TUBA bases its economic results on yearly data. The traffic model is based on hourly flows. Annualisation factors are used to convert modelled hourly traffic conditions (flows, delays, and journey times) into yearly travel benefits.
- 3.30 The annualisation process used to determine annualisation factors for use in the A614/A6097 appraisal is reported in Appendix CC.
- 3.31 Annualisation factors have been calculated for the year June 2017 to May 2018. Each junction has been calculated individually with multiple count locations where available. For annualisation factors to be calculated a count along a major road is needed that meets the following criteria:
- The count is in a prominent position in relation to the modelled area,
  - a full year of traffic flow data exists (divided into hourly intervals) with few gaps; and
  - the flows at the count location are high enough such that the count provides a good representation of the daily flow changes throughout the detailed modelled area.
- 3.32 In the year June 2017 to May 2018 there were 253 weekdays, 104 weekend days and 8 bank holidays. For the purposes of the Annualisation calculations weekend days and bank holidays were classified together.
- 3.33 From the annual two-way flow data, average hourly flows by time of day were calculated with the results shown below in Table 2 and Table 3. As the weekend flow profile does not follow the same pattern as the weekday flow profile the average flow on a weekend day between the hours of 07:00 – 19:00 is assumed to be comparable to an average weekday flow between the hours 10:00 – 16:00. Weekday and Weekend OP average flows (19:00 – 07:00) are assumed to be directly comparable.
- 3.34 The hourly two-way flows were plotted in ascending order and, using calculated annual average AM (weekday), IP (weekday and weekend), PM (weekday) and OP (weekday and weekend) hourly flows, annualisation factors were derived by calibrating the area under the curves in such a way as to approximate the number of observed trips to an acceptable level (detailed in Appendix CC).
- 3.35 The annualisation factors used in the appraisal are shown in Table 3.20

**Table 3.20: Annualisation factors for Appraisal**

Time period	Total hours
AM	648
PM	677
Interpeak	2,997
Offpeak	4,438
<b>Total</b>	<b>8,760</b>

### Vehicle Operating Costs

- 3.36 Vehicle operating cost savings (fuel and non-fuel) are calculated as part of the assessment of TEE benefits and costs using the total travel distance from the model output. Vehicle Operating Costs are directly related to fuel consumption and change in speeds between the DM and DS options.
- 3.37 As each junction within the scheme was modelled in isolation, only a nominal length has been modelled on each approach to the junction.

- 3.38 When considering changes in speed at an isolated junction, the average journey speed through a junction is likely to be low. A Do Something option is therefore more likely to have a proportionally greater effect when considering only the trips that pass through the junction, rather than when considering the change in the overall travel time of a full trip length. For instance, over a short distance, the impact of a small scheme junction improvement may change the average speed through the junction from 15kph to 20kph (33% increase in speed), however the impact of the same junction improvement may change the average speed of a 20 mile journey from 40kph to 42kph (5% increase in journey speed).
- 3.39 Based upon the fuel consumption curve taken from the WebTAG data book, Worksheet A1.3.8, as shown in Figure 3-1, it can be seen that the fuel consumption rises steeply at low speeds.

**Figure 3-1: Fuel Consumption Curve**

- 3.40 This steep change in fuel efficiency at low speeds is likely to over exaggerate the VOC benefits of the Junction Schemes, if partial trip lengths were to be used.
- 3.41 Because the full trip-length of journeys are not represented in the TEE analysis, it was therefore decided that the VOC benefits would be excluded from the junction economic appraisals. In the case where a scheme is predicted to improve journey times, and therefore make vehicle operating costs more efficient, it is considered that excluding the VOC costs will underestimate the economic benefits of the schemes.

### Greenhouse Gases and Indirect Taxes

- 3.42 Indirect tax costs are a direct product of the change in vehicle operating costs, for the same reasons as those described in the previous paragraphs, these costs will not form part of the appraisal process and will be omitted from the AMCB Tables for the individual junctions. This approach will under-estimate the benefits of the scheme.
- 3.43 Greenhouse Gases have been assessed outside of TUBA. The TUBA greenhouse gas analysis has been excluded from economic appraisal.

### Delays during Construction

- 3.44 An economic assessment of delays under construction was undertaken. The cost to road users of delays caused by the scheme construction was assessed and factored to the longest construction phase length at each junction undergoing construction activities. The Present Value Benefits (PVB) results for each junction and the combination of these results generated by the delays under construction produced a disbenefit value of -£15.809 million as seen in Figure 3-2. A Technical note was produced detailing the full results and is within Appendix DD.

**Figure 3-2 Analysis of Monetised Cost and Benefits (AMCB) of delays during construction - (£'000s 2010 Market Prices, discounted to a 2010 present value year)**

Number of weeks/months at each junction	20mo	20w	36w	30w	
	Results output from TUBA - per junction				
	Ollerton	Mickledale	Lowdham	Kirkhill	Total
Economic Efficiency: Consumer Users (Commuting)	-852	7	-2,468	-352	-3,665
Economic Efficiency: Consumer Users (Other)	-1,220	15	-5,339	-1,243	-7,788
Economic Efficiency: Business Users and Providers	-748	12	-3,601	-19	-4,357
<b>Present Value of Benefits (PVB)</b>	<b>-2,820</b>	<b>33</b>	<b>-11,409</b>	<b>-1,614</b>	<b>-15,809</b>

- 3.45 As shown in the table above, Mickledale Lane presents a positive benefit. During construction the minor arm of the 3-arm priority junction is closed, therefore, the junction acts as a free-flowing carriageway with a speed restriction imposed. Due to the reduced flow and delay due to turning movements the junction presented a slight positive benefit during construction. It is noted that Mickledale Phase 2 and 3 are very similar with minor arm, Mickledale Road closed. So as not to overestimate the benefits accrued, recognising that the adopted methodology does not reflected the cost of enforced rerouting due to road closures, Stage 4 has not been included in the delays during construction analysis. This is considered a robust approach.
- 3.46 The large disbenefits at Lowdham predominately occurring in phases 2 and 3 (Four-stage temporary traffic signals). Given the large disbenefits, it is anticipated that the Lowdham delays during construction can be reduced with more detailed consideration of the proposed traffic management (temporary 4-stage traffic signal) arrangement.

### Maintenance

- 3.47 VIA East Midlands prepared an estimate of the ongoing yearly maintenance costs for the A614 MRN Improvement scheme. This estimate of maintenance costs represents the increase in maintenance costs, above existing commitments, to maintain and update the new junctions.
- 3.48 Table 3.21 shows a summary of the estimated operation and maintenance cost impact over the 60-year assessment period, in undiscounted costs, and with a year 1 price advised by VIA East Midlands to be at Q1 2020 prices.

**Table 3.21: Maintenance Estimates (2020 prices)**

	Maintenance
Ollerton Roundabout	£1,058,629
Lowdham Roundabout	£502,856
Mickledale Lane	£1,045,667
Kirk Hill	£803,309
<b>Total</b>	<b>£3,410,461</b>

- 3.49 It was assumed that maintenance costs increase at the same rate as the GDP deflator (i.e. there is zero change in real terms, once inflation has been accounted for). A factor of 0.868 (July 2016 figures) was applied to convert the 2019 prices to 2010 prices.
- 3.50 The factor costs were converted to market prices, by the TUBA software, which applies a factor of 1.19.
- 3.51 The stream of Maintenance costs by junction is presented in Appendix EE.

## 4. Core Travel Time Benefits

- 4.1 Table 4.1 to Table 4.4 show, in monetary terms, the change due to the Do-Something, relative to the Do-Minimum scenario, whilst Table 4.5 is the summation across all junctions. All values in the Transport Economic Efficiency (TEE) table are in 2010 market prices and discounted to a 2010 present value year.
- 4.2 The purpose of the Transport Economic Efficiency (TEE) table is to summarise and present transport user benefits. It shows the net user benefits by group (consumers and businesses, including transport operators), by mode of transport and by impact (time, vehicle operating costs, etc).

6.3 The Present Value of Transport and Economic Efficiency returned the following annualised and discounted user time benefits for the 60-year appraisal period is **£-5.7 million**, showing that as a combined package, the scheme delivers negative TEE benefits for the Low growth scenario.

## 7. Road Safety

- 7.1 The purpose of the road safety assessment is to calculate the monetary benefits of the scheme arising from the change in collision costs between the Do Minimum (DM) and Do Something (DS) scenarios. This is done by calculating the total cost of collisions on the network for the DS and subtracting these from the total cost of collisions in the DM. The road safety assessment for the Scheme was carried out using the software COBALT (Cost and Benefit to Accidents – Light Touch) appraisal program, version 2013.02.
- 7.2 COBALT is software used to appraise the road safety benefits of a highway improvement. The aim of COBALT is to produce a monetised appraisal in accordance with the DfT’s Transport Analysis Guidance (TAG).
- 7.3 The COBALT assessment was run as a single model, but within the model each junction was modelled in isolation. This methodology was adopted since the scheme includes three isolated junction improvements and personal injury collision rates will not change along the length of route between these junctions as a result of the scheme.
- 7.4 Table 7.1 shows the junction numbers used within the COBALT assessment for each junction.

**Table 7.1: COBALT Junction numbers**

Junction	Junction number (DM)	Junction number (DS)
Ollerton	1	2
Mickledale Lane	5	6
Lowdham	11	12

- 7.5 Observed road collisions data was obtained from NCC for the period January 2015 to December 2017 (inclusive). 2018 data was not available at the time of the assessment. This data was used to calculate an observed collision rate for each junction. This observed rate was used for the Do Minimum assessment.
- 7.6 For the Do Something assessment, default COBALT rates were applied for the proposed junction types for Ollerton & Lowdham. For Mickledale Lane, an alternative approach was adopted since NCC had recently upgraded a similar priority junction on the A614 (Rose Cottage, directly north of Deerdale Lane) to signal controlled, as proposed at Mickledale Lane. The similarity of schemes and traffic flows means that an observed rate at Rose Cottage is likely to be more representative than the COBALT default rates and has been applied to Mickledale Lane. Table 7.2 below summarises the junction characteristics at the two junctions:

**Table 7.2: Junction Characteristics of Rose Cottage and Mickledale Lane junctions**

Characteristic	Rose Cottage	Mickledale Lane
Number of Arms	3	3
A614 mainline speed limit	50mph	50mph
2018 12hr Junction Inflow (vehicles)	17,239	19,181
08:00-09:00 Junction Inflow (vehicles)	1,829	1,964
17:00-18:00 Junction Inflow (vehicles)	1,814	1,954

- 7.7 Table 7.3 shows the number of collisions at Rose Cottage and Mickledale Lane from 1999 (with data obtained from Crashmap over this longer duration). This shows the impact of the Rose Cottage signalisation scheme on collision numbers.

**Table 7.3: Number of Collisions at Rose Cottage and Mickledale Lane junctions**

Rose Cottage Scheme

7.8 To calculate a rate from Rose Cottage, guidance has been taken from the Chapter 5 (The Valuation of Accidents at Junctions) of the COBA Manual. The annual number of accidents (A) is calculated according to the following formula:

$$A = a(f)^b$$

7.9 Whereby:

A = Annual number of accidents

a = accident rate coefficient attributed to specific junction type

f = Function of traffic flow

b = Coefficient attributed to specific junction type

7.10 Two collisions have been observed at Rose Cottage since its signalisation, which across a three-year appraisal period (2015 – 2017) yields 0.6667 annual accidents (A). For a junction of its type (3 arm signalised) traffic flow (f) is calculated using an inflow model, whereby the total inflow from all links in thousands of vehicles per annual average day is summated. The traffic flow (f) at Rose Cottage, observed from a 2019 traffic survey, was calculated as 20.547. The b coefficient has been taken directly from the COBA Manual, whereby a 3-arm signalised has a value of 0.610.

7.11 Inputting these values and rearranging the model yields an accident rate coefficient (a) for Rose Cottage of 0.105471.

$$a = A / (f)^b$$

$$a = 0.6667 / (20.547)^{0.610}$$

$$a = 0.105471$$

7.12 The post-signalisation accident rate coefficient (a) from Rose Cottage can be reasonably assumed to represent the typical accident rate at signalised junctions along the A614 corridor, and has been used for accident appraisal at Mickledale Lane in the DS scenario (replacing the default rate generated by COBALT).

7.13 COBALT requires two input files in order to produce its outputs. An economic parameters file, consisting of a series of data tables of standard parameters required to calculate personal injury collision impacts in line with WebTAG guidance, and a scheme specific input file, produced by the user, which contains data specific to the scheme being modelled, such as the scheme network and traffic flows.

7.14 COBALT link and junction types were classified by manually assigning a COBALT type to the model link or junction using observations on the type of link or junction, with characteristics gained from viewing Google Maps. A possible 15 different link types and 96 different junction types can be entered.

7.15 Where links or junctions changed in detail between the DM and DS scheme, these were entered twice:

- once in its 'Without-Scheme' state (e.g. priority junction); and
- once in its 'With-Scheme' state (e.g. signal controlled).

7.16 Annual Average Daily Traffic (AADT) flows (see Section 2.66 – 2.69 for AADT methodology) were entered for the base year (2018), opening year (2023), and future forecast year (2037). Junction flows were represented using AADT entry flows per approach arm. Given this is a fixed trip assessment, the AADT values for the DS and DM are the same.

7.17 Collision costs are calculated by COBALT for every year within the appraisal period of 2023 to 2082 and then summed to give total collision costs in the DM and DS over the whole 60-year appraisal period.

7.18 For each link and each year, a personal injury collision rate per million vehicle kilometres (mvkm), the total distance travelled in mvkm during that year and the monetary value of a single collision has been calculated. Multiplying through for each link and then summing across all links gives the DM or DS network collision costs in a particular year.

7.19 For consistency with other items of cost and benefit, all collision costs are valued in 2010 market prices and discounted to the 2010 present value year.

7.20 Table 7.4 presents the COBALT outputs for the A614 / A6097 corridor junction improvement scheme, whilst Table 6.3 and 6.4 presents the outputs for each individual junction for accident statistics and costs respectively. Full COBALT output data is available in Appendix FF. The data shows that the scheme will lead to a reduction in the number of 'fatal' and 'serious' collisions, however a worsening in the number of collisions classified as 'slight' is noted. This is discussed in more detail below.

7.21 The assessment returned the following annualised and discounted collision benefits for the 60-year appraisal period: **-£0.87M** (i.e. a disbenefit)

**Table 7.4: Collision Risk and Valuation of Collisions (60 year appraisal period)**

	Accidents	Casualties			Accident Costs (£, 000's)
		Fatal	Serious	Slight	
<b>Without-Scheme (DM)</b>	398.5	2.6	34.6	553.6	14,154
<b>With-Scheme (DS)</b>	473.5	1.2	28.6	629.3	15,023
<b>Difference</b>	<b>-75</b>	<b>1.4</b>	<b>5.9</b>	<b>-76.0</b>	<b>-869</b>

Table 7.5: Total accidents across 60 year appraisal by junction

Junction	Do Minimum (DM) accidents	Do Something (DS) accidents	Change in accidents
Ollerton	115.6	163.2	+47.6
Mickledale Lane	79.3	42.1	-37.2
Lowdham	115.3	179.9	+64.6
<b>Total</b>	<b>310.2</b>	<b>385.2</b>	<b>112.2</b>

**Table 7.6: Total cost across 60 year appraisal by junction**

Junction	Do Minimum (DM) cost (£millions)	Do Something (DS) cost (£millions)	Change in cost (£millions)
<b>Ollerton</b>	3,502.3	5,146.2	-1,643.9
<b>Mickledale Lane</b>	4,341.2	1,532.3	2,808.9
<b>Lowdham</b>	3,629.8	5,663.5	-2,033.7
<b>Total</b>	<b>11473.3</b>	<b>12342</b>	<b>-868.7</b>

- 7.22 It is noted that the larger accident disbenefits are associated with the improvements at Ollerton and Lowdham. The proposed junctions fulfil their primary objective of improving capacity. The observed accident rates used in the Do Minimum at the two junctions are much lower than the COBA default values. As such, any comparison against a national default rate will result in a disbenefit. Whilst both junctions will be enlarged to provide additional capacity, the geometry and layout of the proposed junctions are not a large change from the existing and as such it is unlikely that the scheme will lead to a large increase in accidents to the level predicted by COBALT.
- 7.23 One potential alternative assessment approach would be to use a post-opening observed accident rate from a similar scheme. A similar scheme was installed at the A614/A617 Lockwell Hill junction in 2013, however this was installed at a similar time to the A614 Safety Cameras with reduced speed limits along the A614. As such, the use of the Lockwell Hill post opening data may overestimate the accident benefits of the junction and is not deemed a suitable comparator.
- 7.24 For the purposes of a robust assessment, default rates at Ollerton and Lowdham have been retained in the economic appraisal. As such, this represents a 'worst case' assessment.

## 8. Economic Appraisal

### Introduction

- 8.1 Although all the components of the appraisal have to be considered, two key indicators will stand out from this kind of economic assessment: the scheme's benefit to cost ratio (BCR), and its net present value (NPV).
- 8.2 The BCR identifies the ratio between the present value of benefits (PVB) and present value of costs (PVC). The higher the BCR the more benefits a scheme is forecast to deliver, compared with the scheme's costs.

### Transport Economic Efficiency

- 8.3 Table 8.1 shows, in monetary terms, the change due to the Do-Something, relative to the Do-Minimum scenario. All values in the Transport Economic Efficiency (TEE) table are in 2010 market prices, and discounted to a 2010 present value year.

## Analysis of Monetised Cost and Benefits (AMCB)

- 8.5 Table 8.11 to Table 8.14 show the Analysis of Monetised Costs and Benefits (AMCB) summary table showing the PVB, PVC, NPV and BCR for the 60-year scheme analyses for each junction. Table 8.15 shows the Analysis of Monetised Costs and Benefits (AMCB) summary table showing the PVB, PVC, NPV and BCR for the 60-year scheme analyses for all junctions.
- 8.6 A single monetised noise impact of £0.29m has been calculated by VIA EM Environmental Team (December 2020) using the Core growth traffic forecasts at a Package level rather than for each junction therefore the monetised noise benefit is presented in the combined AMCB table for all three sensitivity growth forecasts. The associated TAG workbook are presented in Appendix GG.
- 8.7 A local air quality impact of £0.013m has been calculated separately for the Core forecasts, using the DfT's Air Quality Monetisation Spreadsheet. The associated TAG workbooks are presented in Appendix HH.
- 8.8 The Air Quality team has also provided a monetised carbon benefit of £0.40m (Lower Estimate), £0.87m (Core) and £1.39m (Upper Estimate) from the Defra Emission Factor Toolkit, using the Environmental Workbook traffic data which were extracted from the Core junction models. The Core value has been inserted into the AMCB Table for the full scheme in preference to the carbon value produced by TUBA. The associated TAG workbooks are presented in Appendix II.

8.9 The Department for Transport's "Value for Money Guidance" (2017, www.dft.gov.uk), describes how value for money can be categorised in four classes:

Figure 8-1: DfT Value for Money Guidance

**Box 5.1 Standard Categories**  
*(Transport cost outlays exceed revenues or cost savings)*

VfM Category	Implied by...*
Very High	BCR greater than or equal to 4
High	BCR between 2 and 4
Medium	BCR between 1.5 and 2
Low	BCR between 1 and 1.5
Poor	BCR between 0 and 1
Very Poor	BCR less than or equal to 0

*\*Relevant indicative monetised and/or non-monetised impacts must also be considered and may result in a final value for money category different to that which is implied solely by the BCR. This chapter provides guidance on how to select the final value for money category.*

8.10 The BCR summarised in the AMCB table above, shows that the improvements deliver a positive economic case and represents High value for money. Other appraisal objectives, which have not been monetised, should be taken into account during the decision-making process.

8.11 Table 8.16 shows the Analysis of Monetised Costs and Benefits (AMCB) summary table showing the PVB, PVC, NPV and BCR for the 60-year scheme analyses under a High Growth Scenario.

<b>PVB</b>	<b>129,308</b>
<b>PVC</b>	<b>19,205</b>
<b>NPV</b>	<b>110,103</b>
<b>BCR</b>	<b>6.73</b>

Notes: Note: Costs appear as positive numbers. All entries are discounted to 2010 present values, in 2010 market prices; except for the BCR figures. Summary does not include monetised journey time reliability benefits.

8.12 The BCR summarised in the AMCB table above, shows that the improvements deliver a positive economic case and represents Very High value for money under a High Growth Scenario. Other appraisal objectives, which have not been monetised, should be taken into account during the decision-making process.

8.13 Table 8.17 shows the Analysis of Monetised Costs and Benefits (AMCB) summary table under a Low Growth Scenario showing the PVB, PVC, NPV and BCR for the 60-year scheme analyses.

**Table 8.17: Low Growth Scenario - Analysis of Monetised Cost and Benefits (AMCB) – All Junctions**

Impact	With Scheme
Greenhouse Gases	870
Local Air Quality	13

Travel Time Savings - Business	-4,176
Travel Time Savings – Commuting & Other	-1,541
Collisions	-869
Vehicle Operating Costs	Not Assessed
Indirect tax Revenue	Not Assessed
<b>PVB</b>	<b>-5,417</b>
<b>PVC</b>	<b>19,205</b>
<b>NPV</b>	<b>-24,622</b>
<b>BCR</b>	<b>-0.28</b>

Notes: Note: Costs appear as positive numbers. All entries are discounted to 2010 present values, in 2010 market prices; except for the BCR figures. Summary does not include monetised journey time reliability benefits.

8.14 The BCR summarised in the AMCB table above, shows that the improvements deliver a negative economic case and represents Very Poor value for money under a Low Growth Scenario. Other appraisal objectives, which have not been monetised, should be taken into account during the decision-making process.

## 9. OBR Sensitivity Test

- 9.1 The DfT recently published updated versions of both the TAG Data Book (v1.14) and the Wider Impacts Dataset. These versions are consistent with the July 2020 Office for Budget Responsibility (OBR) forecasts and are intended for use as a sensitivity test in scheme appraisals.
- 9.2 The Forthcoming Change notice “TAG Data Book, appraisal software and TAG appraisal worksheets” states the requirement for scheme promoters to conduct sensitivity tests in modelling and appraisal using TAG Data Book v1.14. This requirement is in place until February 2021, when the updated OBR projections will be incorporated into formal guidance.
- 9.3 It is important to note that this appraisal-only sensitivity testing is likely to understate the full impact of the OBR updates, because no account is taken of the impact on demand.
- 9.4 Sensitivity testing has been undertaken by using the DfT’s TUBA software (Version 1.9.14) and applying the economic parameters file ‘Economics\_TAG\_db1\_14\_0.txt’ which is consistent with TAG Data Book v1.14 July 2020.
- 9.5 Table 9.1 to Table 9.3 show, in monetary terms, the change due to the Do-Something, relative to the Do-Minimum scenario for the Low Growth, Core and High Growth scenarios across all junctions. All values in the Transport Economic Efficiency (TEE) table are in 2010 market prices and discounted to a 2010 present value year.

**Table 9.1: Low Growth Scenario -TEE Table (£ thousands) All Junctions**

9.6 Table 9.4 shows the Analysis of Monetised Costs and Benefits (AMCB) summary table under a Low Growth, Core and High Growth scenario showing the PVB, PVC, NPV and BCR for the 60-year scheme analyses.

**Table 9.4: Analysis of Monetised Cost and Benefits (AMCB)**

Impact	Low Scenario-With Scheme	Core Scenario-With Scheme	High Scenario-With Scheme
Greenhouse Gases	870	870	870
Local Air Quality	13	13	13
Noise	286	286	286
Travel Time Savings - Business	-4,342	3,602	25,500
Travel Time Savings – Commuting & Other	-2,907	37,536	81,003
Collisions	-869	-869	-869
Vehicle Operating Costs	Not Assessed	Not Assessed	Not Assessed
Indirect tax Revenue	Not Assessed	Not Assessed	Not Assessed
<b>PVB</b>	<b>-6,949</b>	<b>41,438</b>	<b>106,803</b>
<b>PVC</b>	<b>19,205</b>	<b>19,205</b>	<b>19,205</b>
<b>NPV</b>	<b>-26,154</b>	<b>22,233</b>	<b>87,598</b>
<b>BCR</b>	<b>-0.36</b>	<b>2.16</b>	<b>5.56</b>

- 9.7 Under the OBR sensitivity scenario the PVB and BCR summarised in the Table 9.4 above, would reduce slightly in all scenarios from those presented in section 8. The BCR summarised in the AMCB table above, shows that under the OBR sensitivity scenario, the improvements deliver a Very Poor value for money under a Low Growth Scenario, High value for money under a Core Scenario and Very High value for money under a High Growth Scenario. Other appraisal objectives, which have not been monetised, should be taken into account during the decision-making process.

# 10. Induced Investment

## Induced Investment Introduction

- 10.1 The Department for Transport’s appraisal process is based on the principles of the HM Treasury Green Book guidance, which advocates the use of cost-benefit (welfare) analysis to determine the value for money of investment spend. Welfare analysis captures a broad range of impacts, such as economic, environmental and social. The results of welfare analysis are reported in the Economic Case and inform the value for money assessment.
- 10.2 The method to estimate the incremental impact on scheme benefits arising from a transport scheme unlocking a development which would not have been possible in the absence of that investment is set out in TAG unit A2.2, Appraisal of Induced Investment (May 2020).

## Land Value Uplift

- 10.3 TAG Unit A2.2, Appraisal of Induced Investment, May 2020 provides guidance on how to quantify and value induced investments impacts – changes in the level or location of private sector investment as a result of a transport investment – for their inclusion within transport appraisal as part of the value for money assessment; and as non-welfare metrics such as number of jobs and GDP. The assessment of Land Value Uplift associated with Dependent Development sites identified in Section 2 is in accordance with TAG Unit A2.2, Appendix D, Derivation of Land Value Uplift.
- 10.1 The Wider Economic Impacts Report (December 2020) contained in Appendix JJ of this report details:
- The methodology used to assess potential land value uplift associated with the scheme;
  - A summary of the quantum of housing and employment land on the dependent sites;
  - Key assumptions used in the assessment and sensitivity testing.
- 10.2 As noted in Table 3.1, the DfT’s Value for Money Framework states that whilst benefits associated with Induced Investment should not be included in the initial benefit-cost metrics, it may be used to inform the scheme’s value for money assessment. As such, Land Value Uplift benefits are excluded from the initial Analysis of Monetised Costs and Benefits but are presented to support the value for money case.
- 10.3 The Scheme is estimated to deliver £21.5m gross LVU, which is equivalent to £13.3m net additional Land Value Uplift.

**Table 10.1: Land Value Uplift Summary (£millions)**

	Gross impact of Scheme	Net impact of Scheme
Residential Land Value Uplift	£21.0m	£13.0m
Commercial Land Value Uplift	£0.5m	£0.3m
<b>Total LVU</b>	<b>£21.5m</b>	<b>£13.3m</b>

Source: Wider Economic Impacts Report, 2020; Values at 2010 prices

- 10.4 As noted, Land Value Uplift Benefits are excluded from the initial Analysis of Monetised Costs and Benefits but are presented in section 11 to inform the value for money case.

## Transport External Costs

- 10.5 Transport External Costs refer to the impacts imposed by the transport users generated by the dependent development sites on all other transport users, such as increased levels of congestion.
- 10.6 The Dependent Development demand forecasts are detailed in Section 2.

- 10.7 The assessment of transport external costs of the dependent development requires two transport model runs:
- Scenario S - without the new housing but with the transport scheme; and
  - Scenario R - with the new housing and with the transport scheme
- 10.8 The TEC assessment, in accordance with TAG Unit A2.2, paragraph 3.3.10 consisted:
- Scenario S – Core Scenario Demand assigned on to the Do Something junction models
  - Scenario R –Dependent Development Demand assigned onto the Do Something junction models
- 10.9 A TEC analysis was undertaken using the Ollerton and Lowdham ARCADY models as detailed above. Outputs from the junction models for the 2023 opening year (Scenario S and R in 2023), 2037 non-dependent growth (Scenario S) and 2037 dependent growth scenarios (Scenario R).
- 10.10 The methodology as detailed in TAG guidance unit A2.2 (May 2020) and the Department for Transport TUBA software V1.9.14 was used to undertake this analysis, with the TUBA economic parameters file (23/08/2020 v2, TAG Data Book v1.13.1 July 2020).
- 10.11 The TEC are summarised for each junction in Table 1 below.

**Table 10.2: A614 Transport External Costs (£millions)**

	Ollerton TEC	Lowdham TEC	Combined TEC
Consumer User Benefits - Commuting	-0.868	-0.754	-1.622
Consumer User Benefits - Other	-2.652	-0.961	-3.613
Business User Benefits	-1.830	-0.641	-2.471
<b>Net Present Value of Benefits (PVB)</b>	<b>-5.350</b>	<b>-2.356</b>	<b>-7.706</b>
Notes: All entries are in market prices, at present values discounted to 2010, at 2010 market prices, in £ millions.			

- 10.12 The TAG assessment of Transport External Costs results in an overall disbenefit with Present Value of Benefits of -£7.706m.
- 10.13 These TEC impacts represent an increase in costs to existing road users as a result of the addition of new trips from the dependent development sites.
- 10.14 As noted in Table 2.1, the DfT's Value for Money Framework states that whilst benefits associated with Induced Investment should not be included in the initial benefit-cost results, it may be used to inform the scheme's value for money assessment. As such, monetised TEC impacts were excluded from the initial Analysis of Monetised Costs and Benefits but are presented to support the value for money case.

## Land Amenity Value (LAV)

- 10.15 The 'amenity value' of a plot of land refers to the level of pleasantness of the area. TAG Unit A2.2 'Appraisal of Induced Investment, May 2020 provides guidance on how to quantify Land Amenity Value.
- 10.16 The TAG Data Book 'Valuing Dependent Development Workbook', incorporates estimates obtained by Department of Communities and Local Government (2001) and has been used as the basis of the LAV assessment of Thoresby Colliery and Teal Close development sites. The welfare impact from the change in land amenity value has been estimated as the difference between the present value benefits for different land types.
- 10.17 The LAV assessment is presented in the Wider Economic Impacts Report (Dec 2020) contained in Appendix JJ of this report.

- 10.18 At Thoresby Colliery, the development will take place on brownfield land and is anticipated to result in land amenity value gain. However, there is currently limited evidence available on the external amenity impact of development on brownfield land. As a conservative assumption and in line with the DCLG appraisal guide, it is assumed that the change in amenity value on the Thoresby Colliery site is zero.
- 10.19 At Teal Close, development will take place on agricultural land predominantly used to grow crops. This land is considered to have limited amenity value in terms of recreation or pleasantness of the area, and its agricultural uses are restricted to crops due history of site use for sewage sludge. 52 This type of land aligns with the definition for intensive agricultural land, with estimated land amenity value of £29,000 per hectare in perpetuity. The delivery of net additional 8.9ha of residential development at Teal Close is therefore estimated to amount to an amenity loss of £258,000 in present value (in 2010 prices).

## Induced Investment Summary

- 10.20 TAG Unit A2.2, Table 2 sets out the formula for valuing the benefits of Dependent Development:

$$Total\ Benefits = LVU_D + Other - TEC - LAV - NTCI$$

Where:

*LVU<sub>D</sub>*: Land Value Uplift adjusted for displacement (see paragraph 10.3);

*Other*: This includes Environmental Impacts, and Social and Distributional Impacts – TAG units A3 and A4 respectively (Not assessed);

*TEC*: Transport External Costs (see paragraph 10.5);

*LAV*: Land Amenity Value (see paragraph 10.15); and

*NTCI*: This refers to the costs associated with Non-Transport Complementary Interventions – the benefits are assumed to be captured by the land value uplift (no further assessment).

- 10.21 On this basis the total benefits of Dependent Development associated with the A614 Improvements are:

**Table 10.3: A614 Induced Investment Benefits (£millions)**

Induced Investment Benefits	Benefit (£m)
Land Value Uplift	£13.300m
Transport External Costs	-£7.706m
Land Amenity Value	-0.258m
Other	Not Assessed
Non-Transport Complementary Interventions	Not Assessed
<b>Total Induced Investment</b>	<b>£5.336M</b>
Notes: All entries are in market prices, at present values discounted to 2010, at 2010 market prices, in £ millions.	

# 11. Analysis of Monetised Costs and Benefits – Induced Investment

- 11.1 As noted in Table 3.1, the inclusion of indicative monetised impacts such as Induced Investment should be considered after the presentation of established and evolving monetised impacts. Section 8 presents the AMCB tables using the established monetised impacts. No evolving monetised impacts have been assessed at this stage.
- 11.2 Section 10 presents the Land Value Uplift (LVU) benefits and Land Amenity Values associated with the Scheme and the assessment of Transport External Costs (TEC). These were assessed using TAG Unit A2.2, Induced Investment, May 2020 and are both considered to be indicative monetised impacts. As such, the Induced Investment impacts have been excluded from the AMCB table in Section 8 but are included below to inform the Value for Money assessment.
- 11.3 Presented in Table 11.1 is the Analysis of Monetised Costs and Benefits (AMCB) summary table based upon the Core growth forecast assignments, taking the induced investment into account, and showing the PVB, PVC, NPV and BCR for the 60-year scheme analyses.

**Table 11.1: Core Scenario with Induced Investment - Analysis of Monetised Cost and Benefits (AMCB) – All Junctions**

Impact	With Scheme
Greenhouse Gases	870
Local Air Quality	13
Noise	286
Economic Efficiency – Business	5,155
Economic Efficiency – Commuting & Other	45,890
Collisions	-869
Induced Investment	5,336
Vehicle Operating Costs	Not Assessed
Indirect tax Revenue	Not Assessed
<b>PVB</b>	<b>56,681</b>
<b>PVC</b>	<b>19,205</b>
<b>NPV</b>	<b>37,476</b>
<b>BCR</b>	<b>2.95</b>

Notes: Note: Costs appear as positive numbers. All entries are discounted to 2010 present values, in 2010 market prices; except for the BCR figures. Summary does not include monetised journey time reliability benefits.

- 11.4 The BCR summarised in the AMCB table above, shows that the improvements deliver a positive economic case and represents High value for money under a Core Scenario with Induced Investment considered. Other appraisal objectives, which have not been monetised, should also be taken into account during the decision-making process.

## High Alternative Growth – with Induced Investment

11.5 Table 11.2 shows the AMCB summary table based upon the High Growth Scenario, incorporating the induced investment benefits, and showing the PVB, PVC, NPV and BCR for the 60-year scheme analyses.

**Table 11.2: High Growth Scenario with Induced Investment - Analysis of Monetised Cost and Benefits (AMCB) – All Junctions**

Impact	With Scheme
Greenhouse Gases	870
Local Air Quality	13
Noise	286
Economic Efficiency – Business	31,206
Economic Efficiency – Commuting & Other	97,802
Collisions	-869
Induced Investment	5,336
Vehicle Operating Costs	Not Assessed
Indirect tax Revenue	Not Assessed
<b>PVB</b>	<b>134,644</b>
<b>PVC</b>	<b>19,205</b>
<b>NPV</b>	<b>115,439</b>
<b>BCR</b>	<b>7.01</b>

Notes: Note: Costs appear as positive numbers. All entries are discounted to 2010 present values, in 2010 market prices; except for the BCR figures. Summary does not include monetised journey time reliability benefits.

11.6 The BCR summarised in the AMCB table above, shows that the improvements deliver a positive economic case and represents Very High value for money under a High Growth Scenario with Induced Investment considered. Other appraisal objectives, which have not been monetised, should be taken into account during the decision-making process.

## Low Alternative Growth – with Induced Investment

11.7 Table 11.3 shows the AMCB summary table based upon the Low Growth Scenario, incorporating the induced investment benefits, and showing the PVB, PVC, NPV and BCR for the 60-year scheme analyses.

**Table 11.3: Low Growth Scenario with Induced Investment - Analysis of Monetised Cost and Benefits (AMCB) – All Junctions**

<b>Impact</b>	<b>With Scheme</b>
Greenhouse Gases	870
Local Air Quality	13
Noise	286
Economic Efficiency – Business	-4,176
Economic Efficiency – Commuting & Other	-1,541
Collisions	-869
Induced Investment	5,336
Vehicle Operating Costs	Not Assessed
Indirect tax Revenue	Not Assessed
<b>PVB</b>	<b>-81</b>
<b>PVC</b>	<b>19,205</b>
<b>NPV</b>	<b>-19,286</b>
<b>BCR</b>	<b>-0.00</b>

Notes: Note: Costs appear as positive numbers. All entries are discounted to 2010 present values, in 2010 market prices; except for the BCR figures. Summary does not include monetised journey time reliability benefits.

11.8 The BCR summarised in the AMCB table above, shows that the improvements deliver a neutral economic case and represents Very Poor value for money under a Low Growth Scenario with Induced Investment considered. Other appraisal objectives, which have not been monetised, should also be taken into account during the decision-making process.

# 12. Summary and Conclusions

## Summary

- 12.1 The economic assessment for the A614/A6097 Major Road Improvement Scheme was undertaken using the TUBA economic appraisal software and the COBALT accident appraisal software, for a 60-year appraisal period of 2023-2082 inclusive.
- 12.2 The economic assessment of the A614/A6097 Major Road Improvement Scheme was based upon the assignment of a forecast Core Growth Scenario, with sensitivity tests using Low alternative growth and High alternative growth assumptions. The Core Growth Scenario traffic forecast is based upon what the most likely land use and traffic growth assumptions.
- 12.3 Outputs from isolated junction models were used in the economic appraisal of the scheme to produce a monetised cost benefit analysis. The monetised cost benefit analysis of the scheme included the assessment of road user benefits and changes in revenues (i.e. indirect taxes), accident costs, and road-user costs during construction.
- 12.4 The assessments of Induced Investment (Land Value Uplift, Transport External Costs and Land Value Uplift) associated with Dependent Development sites identified in the Forecasting Package were documented.

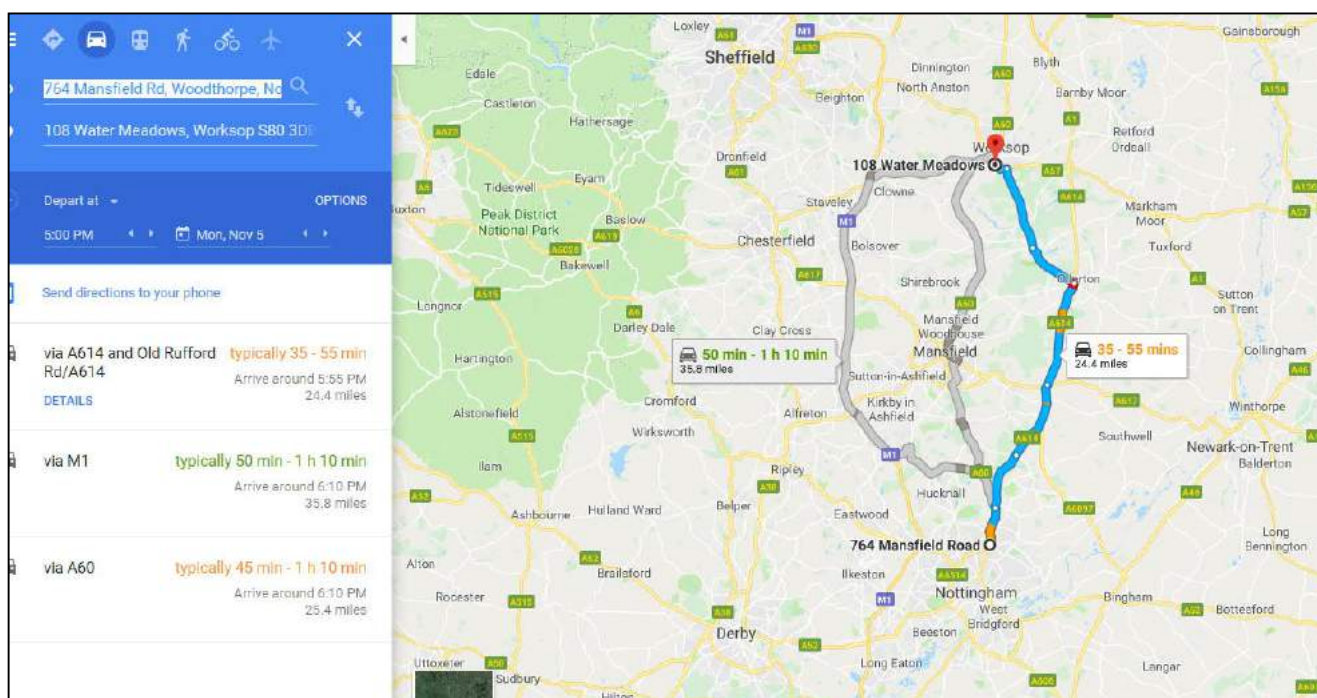

## Conclusions

- 12.5 The Core growth TEE benefits including the delays during construction, excluding accident benefits, carbon benefits, indirect tax revenue impacts and maintenance operations were £51.0 million (Table 4.5- 2010 market prices discounted to a 2010 present value year).
- 12.6 The High growth TEE benefits including the delays during construction, excluding accident benefits, carbon benefits, indirect tax revenue impacts and maintenance operations were £129.0 million (Table 5.5- 2010 market prices discounted to a 2010 present value year).
- 12.7 The Low growth TEE benefits including the delays during construction, excluding accident benefits, carbon benefits, indirect tax revenue impacts and maintenance operations were -£5.7 million (Table 6.5- 2010 market prices discounted to a 2010 present value year).
- 12.8 Accident costs over the appraisal period were appraised using the COBALT accident analysis software. Recorded accident data within Nottinghamshire were used to establish observed accident rates for each junction. For the Do Something assessment, default COBALT rates were applied for the proposed junction types for Ollerton & Lowdham. For Mickledale Lane, an alternative approach was adopted since NCC had recently upgraded a similar priority junction on the A614 (Rose Cottage, directly north of Deerdale Lane) to signal controlled, as proposed at Mickledale Lane.
- 12.9 The accident analysis showed that the implementation of the Scheme would result in a monetised benefit (refer to Table 7.4 ) of £-0.87 million in 2010 market prices discounted to a 2010 present value year.
- 12.10 Scheme cost estimates including developer contributions were provided by Nottinghamshire County Council in the form of a Most Likely Cost Estimate and were referred to as Investment Costs. The Present Value investment cost of the scheme (i.e. in 2010 market prices and discounted to a 2010 present value year) is £19.21 million (refer to Table 8.10).

- 12.11 A combined monetised noise impact of £0.29 million, a local air quality impact of £0.013 million and monetised carbon benefit of £0.87 million have been calculated by the VIA East Midlands and AECOM (December 2020).
- 12.12 The Core growth forecast results, were (all costs in 2010 market prices discounted to a 2010 present value year):
- PVB £51.4M
  - PVC £19.2M
  - NPV £32.1M
  - BCR 2.67
- 12.13 For the Core growth forecast, the TUBA appraisals produced an overall NPV of £32.1 million (refer to Table 8.15) in 2010 market prices discounted to a 2010 present value year. This NPV included accident benefits, carbon benefits, construction delay disbenefits and indirect tax impacts. The BCR is 2.67, which the DfT would categorise as High value for money.
- 12.14 In addition to an assessment of the Core growth forecast, and in line with TAG advice, uncertainty in the forecasting process was considered through the preparation of two alternative growth forecasts referred to as Low and High alternative growth scenarios.
- 12.15 For the High growth forecast, the TUBA appraisals produced an overall NPV of £110.1 million (refer to Table 8.16) in 2010 market prices discounted to a 2010 present value year. This NPV included accident benefits, carbon benefits, construction delay disbenefits and indirect tax impacts. The BCR is 6.73, which the DfT would categorise as Very High value for money.
- 12.16 For the Low growth forecast, the TUBA appraisals produced an overall NPV of £-24.6 million (refer to Table 8.17) in 2010 market prices discounted to a 2010 present value year. This NPV included accident benefits, carbon benefits, construction delay disbenefits and indirect tax impacts. The BCR is negative, which the DfT would categorise as Very Poor value for money.
- 12.17 Sensitivity testing has been undertaken to review the impact of the July 2020 Office for Budget Responsibility (OBR) forecasts by using the DfT's TUBA software (Version 1.9.14) and applying the economic parameters file 'Economics\_TAG\_db1\_14\_0.txt' which is consistent with TAG Data Book v1.14 July 2020. Under an OBR forecast scenario the PVB and BCR would reduce slightly in all scenarios.
- 12.18 In accordance with DfT Value for Money Guidance, the benefits associated with Induced Assessment (Land Value Uplift, Transport External Costs and Land Amenity Value) were excluded from the initial analysis of monetised costs and benefits.
- 12.19 The Scheme is estimated to deliver £5.336m additional induced Investment benefits (Table 10.3).
- 12.20 For the Core growth forecast, including Induced Investment impacts, the appraisals produced an overall NPV of 37.5 million (refer to Table 11.1) in 2010 market prices discounted to a 2010 present value year. This NPV included accident benefits, carbon benefits, construction delay disbenefits, indirect tax impacts, land value uplift, Transport External Costs and Land Amenity Value.
- 12.21 The Core growth forecast results, with induced investment, were (all costs in 2010 market prices discounted to a 2010 present value year):
- PVB £56.7M
  - PVC £19.2M
  - NPV £37.5M
  - BCR 2.95

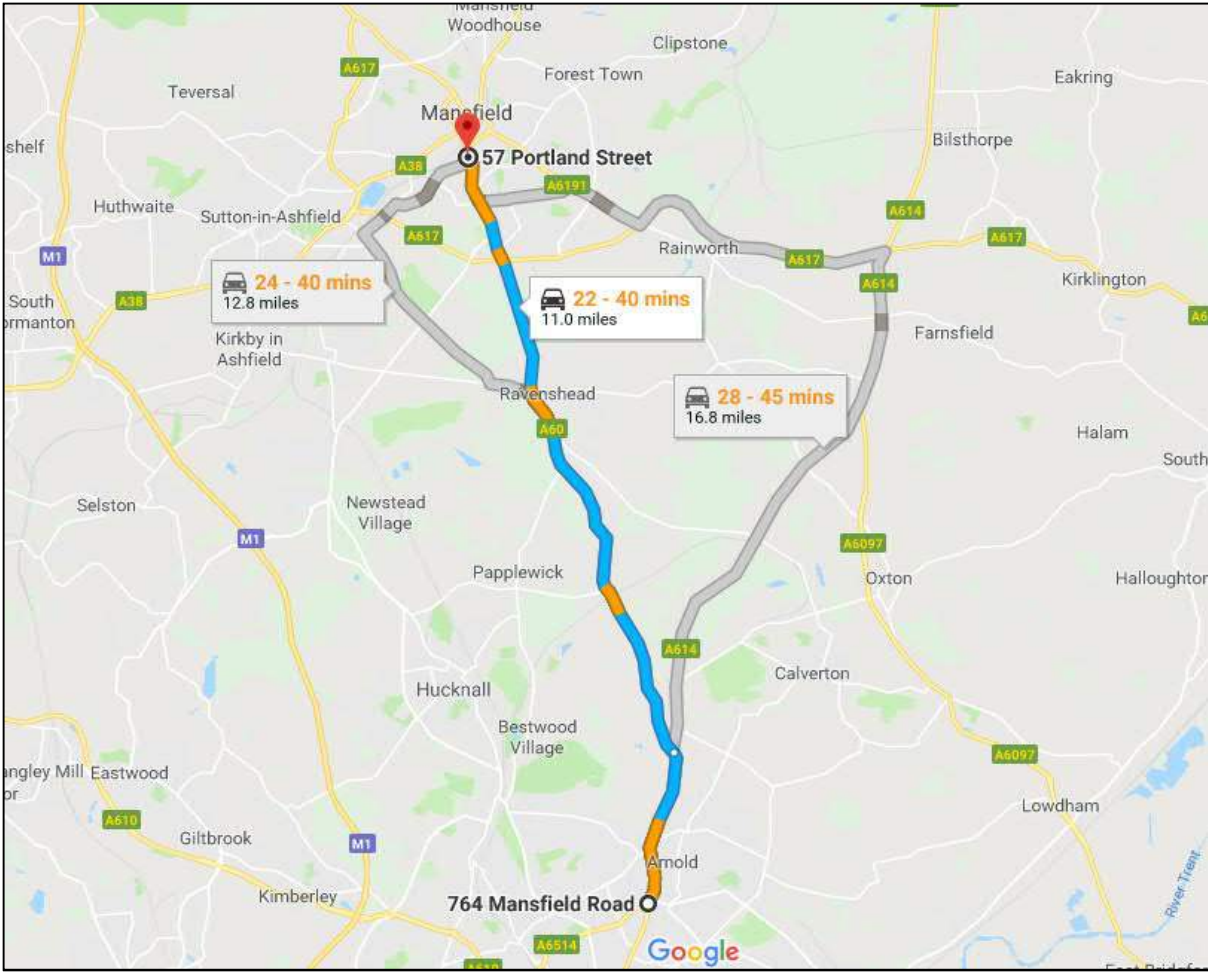

- 12.22 With the inclusion of Induced Investment, the Scheme's economic appraisals, using the High alternative growth and Low alternative growth forecasts resulted in positive BCR values of 7.01 and 0.00 respectively (Table 11.2 and Table 11.3).
- 12.23 In transport economy terms, the combined package of improvements would provide high value for money under a Core and High growth scenario.

# Appendix A – Route Choice Comparisons

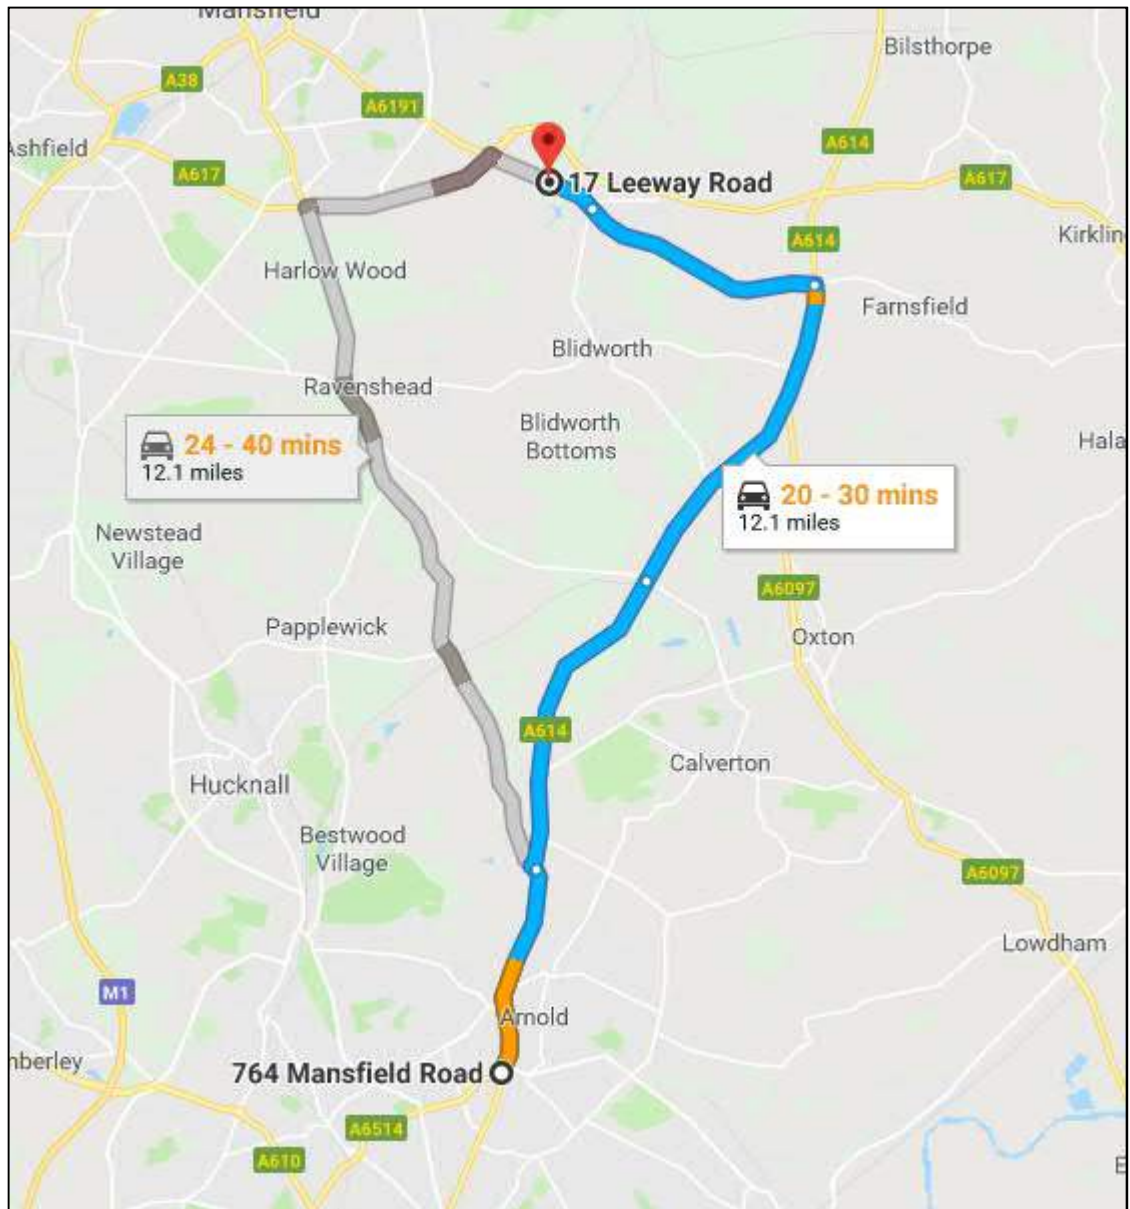

Whilst the A60 does provide an alternative route between Worksop and Nottingham, there is typically a 10 minute difference in predicted journey times in peak periods. In addition, the A60 route requires trips to route through the centre of Mansfield, which adds uncertainty to the journey time reliability of the A60. This is reflected in the wider range of predicted journey times shown above.

Between Mansfield and Nottingham, the shortest and quickest route is via the A60. The A614 is 4 miles longer and typically at least 6 minutes longer.

For trips with an origin or destination to the east of the MARR/Southwell Road roundabout, the A614 is the quicker route, although the A60 is same distance.

## A614 Strategic Assessment

---

The A614/A6097 MRN Improvement Scheme is a series of junction improvements along the A614 corridor in Nottinghamshire being promoted by Nottinghamshire County Council (NCC). An Options Assessment Report (OAR) has been prepared in accordance with Stage 1 of the Transport Appraisal Process - Option Development.

A methodology using a simple fixed trip forecasting approach and isolated junction models was pre-approved by the Department for Transport (DfT) in December 2018. This was on the basis that there is minimal route choice and the improvements are relatively modest capacity improvements. In addition, given the original programme constraints there was no time to develop a traffic assignment model for the improvement corridor.

Following a DfT review of the Outline Business Case, DfT has requested a more in-depth analysis particularly around the schemes, Variable Demand Model (VDM) impacts and the potential for reassignment.

DfT's specific comments are:

*"#37: Given the scale of the scheme spatially (approximately 14 miles of road network), the scheme cost and the current and forecast levels of congestion, a variable demand approach is warranted based on guidance on TAG Unit M2.*

*"Additional: Notwithstanding earlier engagement with DfT, the methodology employed to model and appraise the effects of the scheme (excluding the impacts of re-routing and variable demand responses) are a significant departure from guidance. This will lead to a low level of assurance of the analysis supporting the scheme appraisal and we want to work with you to investigate how we can best mitigate this issue. Some limited evidence has been provided about the potential impacts; however, it would be helpful to discuss what further evidence you may have available and/or what further analysis/sensitivity tests could be undertaken. Any thoughts you might have on this would be helpful and this is an issue we would wish to discuss further with you once you have had a chance to consider."*

Modelling the scheme within the Midlands Connect Highway Model (MCHM) is proposed in order to address the above comments. To this end, a review of the performance of the MCHM along the A614/A6097 corridor has been undertaken. This included a simple local base year validation exercise along the corridor to demonstrate the model's suitability and robustness for testing the scheme.

The exercise has involved the examination of the existing model validation in the area of the scheme corridor, and a count comparison exercise looking at a number of count sites

in the local area of the scheme corridor. A comparison of modelled and observed journey times has also been undertaken. No additional model calibration has been undertaken.

The model used is a SATURN model, and is a variant of the Highways England Midlands Regional Transport Model, which was developed using data from March 2015. It has been run in SATURN version 11.3.12U – the version in which it was validated.

Following the model review, the scheme has been tested within the MCHM, with the purpose of checking that there is no major reassignment impact as a result of the scheme.

The forecast model years in the MCHM are 2026, 2031 and 2041. The A614 scheme economic case is based on the forecast years 2023 (opening year) and 2037 (design year). To reconcile these differences in forecast years, the 2031 MCHM forecast year has been used, as a mid-way point between the two appraisal years, for the sensitivity assignments. Both the reassignment and VDM were conducted for 2031 and presented in the main body of the technical note.

# Existing Model Validation

## Background

The MCHM is a variant of the Highways England Midlands Regional Traffic Model. The model as a whole is validated and has its own model validation report. The model has a wide geographical coverage including the whole of the Midlands region and therefore the report was examined in order to check specifically for how well the model validates in the area of the scheme corridor and its surrounds.

## Journey Times

A standard approach using journey times and flows was adopted when producing the model validation report for the Midlands Regional Transport Model.

In terms of journey times, the model validation report examined a number of journey time routes, which are then broken down in to shorter journey time groups. The performance of these against TAG acceptability criteria is summarised in the table below, which is taken from Tables 10.19, 10.20 and 10.21 of the model validation report. TAG acceptability criteria dictate that “modelled times along routes should be within 15% of surveyed times (or 1 minute, if higher than 15%).”

**Table 1 - Model Validation Report journey time summary**

	Number of routes/groups	AM	IP	PM
<b>All Routes</b>				
Journey Time Routes Difference <15%	144	83%	88%	77%
Journey Time Routes Difference <25%	144	94%	96%	92%
Journey Time Groups Difference <15%	700	77%	81%	77%
Journey Time Groups Difference <25%	700	89%	93%	89%
<b>Motorways Only</b>				
Journey Time Groups Difference <15%	125	87%	90%	88%
Journey Time Groups Difference <25%	125	98%	98%	98%

This shows that generally, the model as a whole performs well, with 83%, 88% and 77% of journey time routes in the AM, IP and PM peaks meeting the TAG acceptability criteria. This improves when looking at journey time groups on motorways, where 87%, 90% and 88% of journey time groups pass the TAG acceptability criteria. Given the main function of the model is for strategic forecasting, this is important.

One of the journey time routes used includes the proposed scheme corridor and is looked at specifically here. The route runs along the A6097 from its junction with the A46 near East Bridgford, then joins the A614 at Warren Hill and continues along it to its junction with the A1 and A57 near Upper Morton.

The differences between observed and modelled journey time are summarised in the table below, having been taken from the model validation dashboard.

**Table 2 - Model Validation Report A614 journey time route summary**

A614/A6097 Time and Direction	Modelled/Observed Journey Time Differences
AM Northbound	10.3%
AM Southbound	0.7%
IP Northbound	3.4%
IP Southbound	-1.7%
PM Northbound	1.7%
PM Southbound	1.1%

It can be seen that for all periods and all directions, the TAG acceptability criteria are met on this route. Positive percentages indicate that the model is slightly slower in relation to observed journey times, which the route is in all cases, except for southbound in the interpeak. All of the modelled journey times are within 15% of the observed times.

This is reflected in some of the journey time plots extracted from the appendices of the model validation report, shown below and cropped down to focus on the study area and its surrounds. Green lines show links for which modelled time is within 15% of observed time (and therefore meets the TAG acceptability criteria), while yellow lines indicate a 15-20% difference, orange a 20-25% difference and red a 25% plus difference. The blue dashed line highlights the scheme corridor area.

Figure 1 - AM journey times A614/A6097 area (from model validation report)

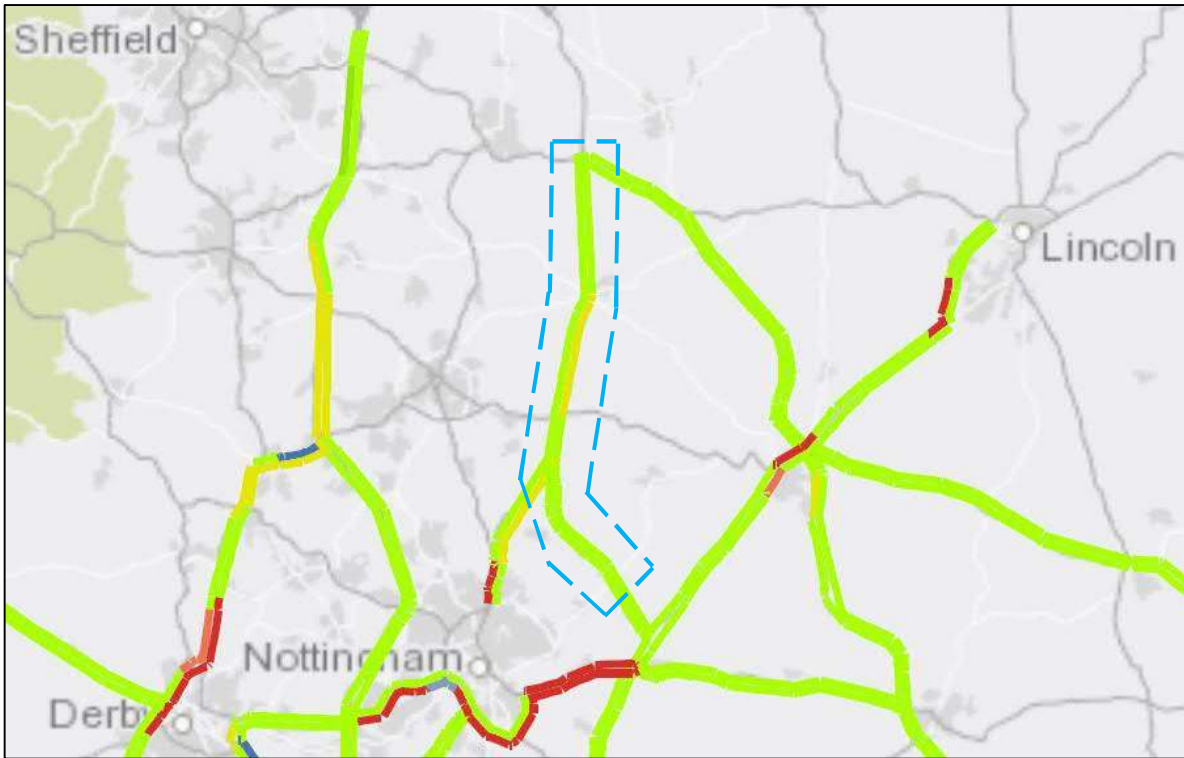

Figure 2 - IP journey times A614/A6097 area (from model validation report)

**Figure 3 - PM journey times A614/A6097 area (from model validation report)**

In some sections, marked in yellow on southbound sections of the A614, the model timings are slower than the observed times by between 15% and 20%. Otherwise, the majority of the scheme corridor is coloured green, demonstrating that modelled journey times are within 15% of the observed journey time – the critical threshold for TAG acceptability. In the AM peak, the red section southbound along the A614 from Warren Hill indicates a section that is more than 25% slower in the model than is observed.

**Traffic Counts**

The plots below, also taken from the model validation report, show the GEH statistic for links included in the model validation. Green lines indicate the GEH is below five, and therefore meets the TAG acceptability criteria, while various shades of blue show differing degrees of modelled flow being less than the observed, and various shades of red showing the modelled flow being more than the observed flow all with GEH values greater than minus or plus 5.0. The plots show GEH calculated for all flow on the link. The blue dashed line highlights the scheme corridor area.

**Figure 4 - AM GEH (from model validation report)**

**Figure 5 - IP GEH (from model validation report)**

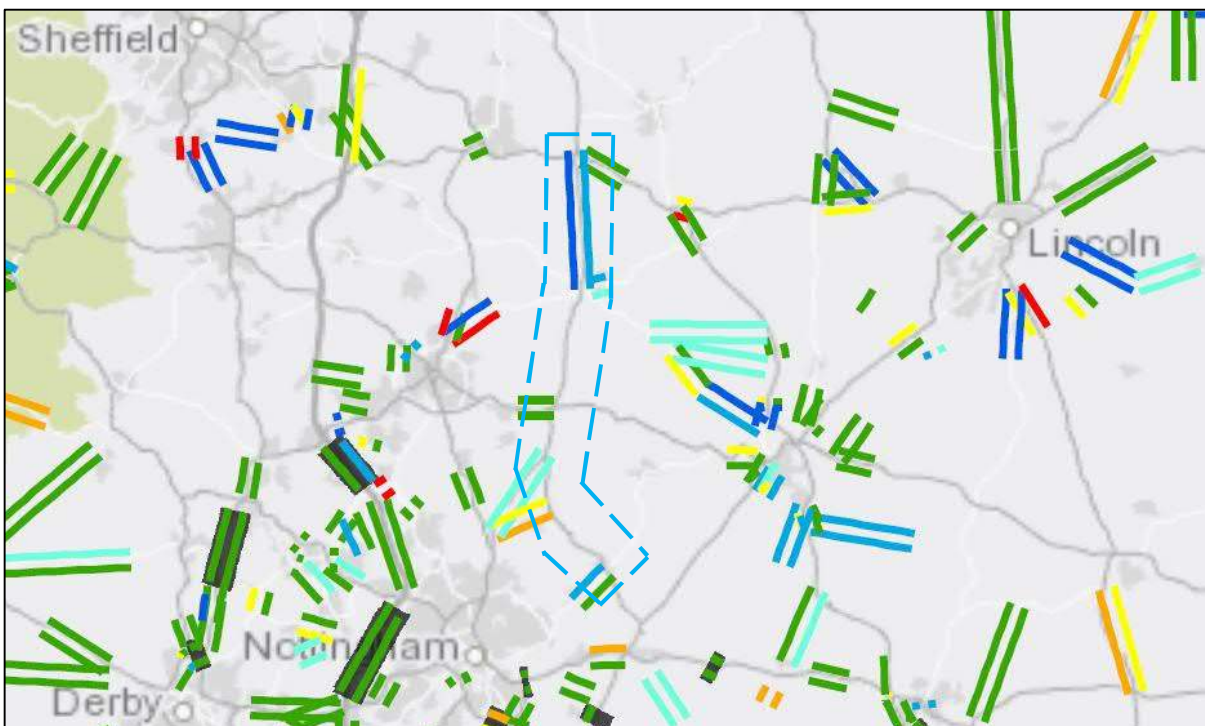

Figure 6 - PM GEH (from model validation report)

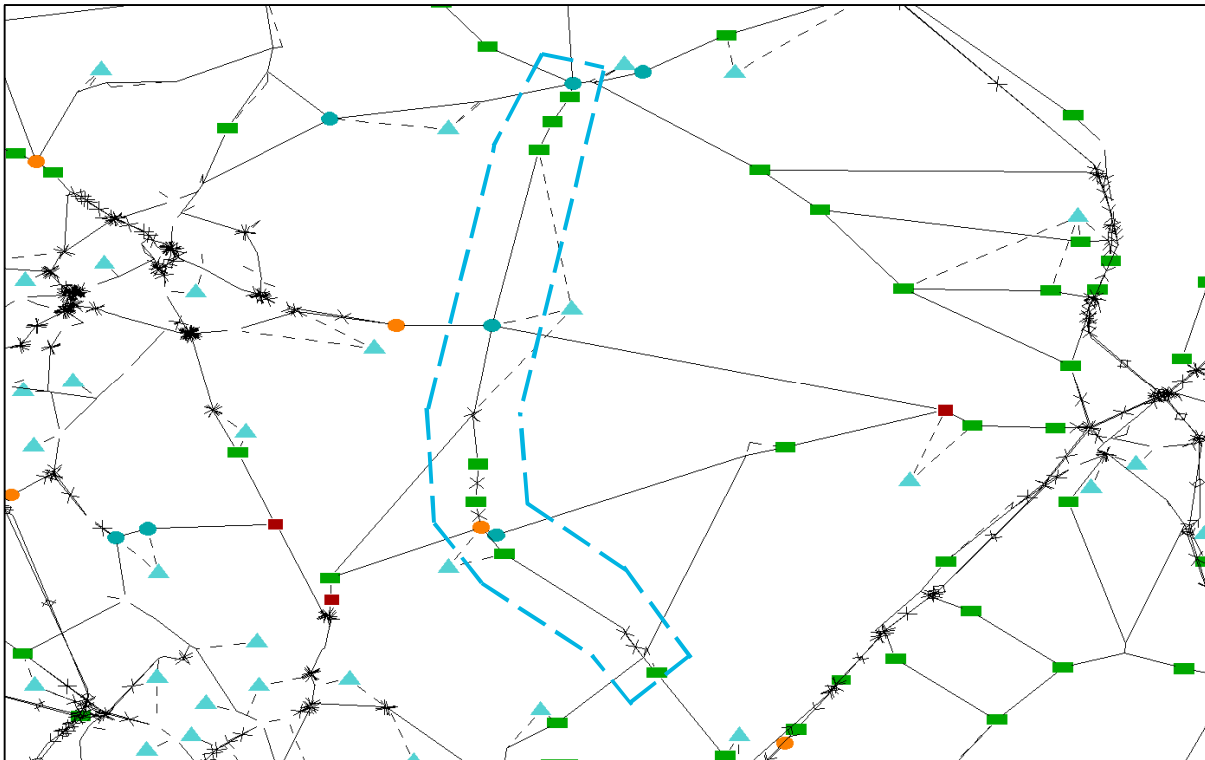

It is noticeable that, across all time periods, the modelled flows are less than observed on the A614 south of Warren Hill, but higher than observed on the B6386, which links the A614 and A6097. This indicates a possible routing issue in terms of the choice between these two routes, although, due to spider connectors loading traffic from zones on to links in the area, it would be expected that it would be more difficult to validate counts.

In terms of alternative routes, generally the M1 performs better, which was to be expected knowing the model performs strongly on the strategic road network. Alternative corridors to the east have the same issues referenced above with regard to zone loading in areas away from the strategic road network.

In order to illustrate the issues referenced above with regard to zone loading, the plot below shows the SATURN network on the scheme corridor and its surrounds, which illustrates the use of spider connectors for zone loading which span multiple nodes in most areas away from the motorway network. Blue triangles indicate model zones.

**Figure 7 - Midlands Connect Model network structure**

There are two validation counts on the A614 itself included in the model validation dashboard – one to the south of Warren Hill, and one to the north of the Ollerton roundabout. The percentage difference in flow for each time period is shown here, alongside the relevant GEH statistic.

**Table 3 - A614 validation counts from RTM validation dashboard**

Location	SATURN link	AM Difference	AM GEH	IP Difference	IP GEH	PM Difference	PM GEH
A614 North of Ollerton (NB)	42060_42132	-42.3%	13.4	-37.1%	10.5	-37.7%	11.5
A614 North of Ollerton (SB)	42132_42060	-36.3%	11.2	-30.7%	8.6	-34.1%	10.6
A614 South of Warren Hill (SB)	41758_41708	-33.7%	10.6	-34.2%	7.6	-30.1%	8.3
A614 South of Warren Hill (NB)	41708_41758	-48.0%	14.0	-34.9%	7.7	-54.2%	18.2

It can be seen that across all time periods and count sites, the modelled flow is less than the observed flow. Validation on the corridor is particularly compromised by the zone to the east of the A614, taken to represent the village of Bilsthorpe and the surrounding area, which employs spider connectors spanning three nodes along the scheme corridor in order to load and unload traffic from the network. Indeed, one of the spider connectors loads directly in to the Warren Hill junction, which is one of the junctions to be improved as part of the scheme.

## Comparison to Existing Counts

The modelled data in various areas were compared to a number of additional counts, drawn from two different sources:

- Highways England WebTRIS counts; and
- Nottinghamshire County Council's C2Web traffic count database.

Counts were selected in order to take into account the main scheme corridor (A6097 and A614), parallel routing options (like the A46 and A1 via Newark, the M1, and the A60 via Mansfield), and east-west routes crossing the main scheme corridor.

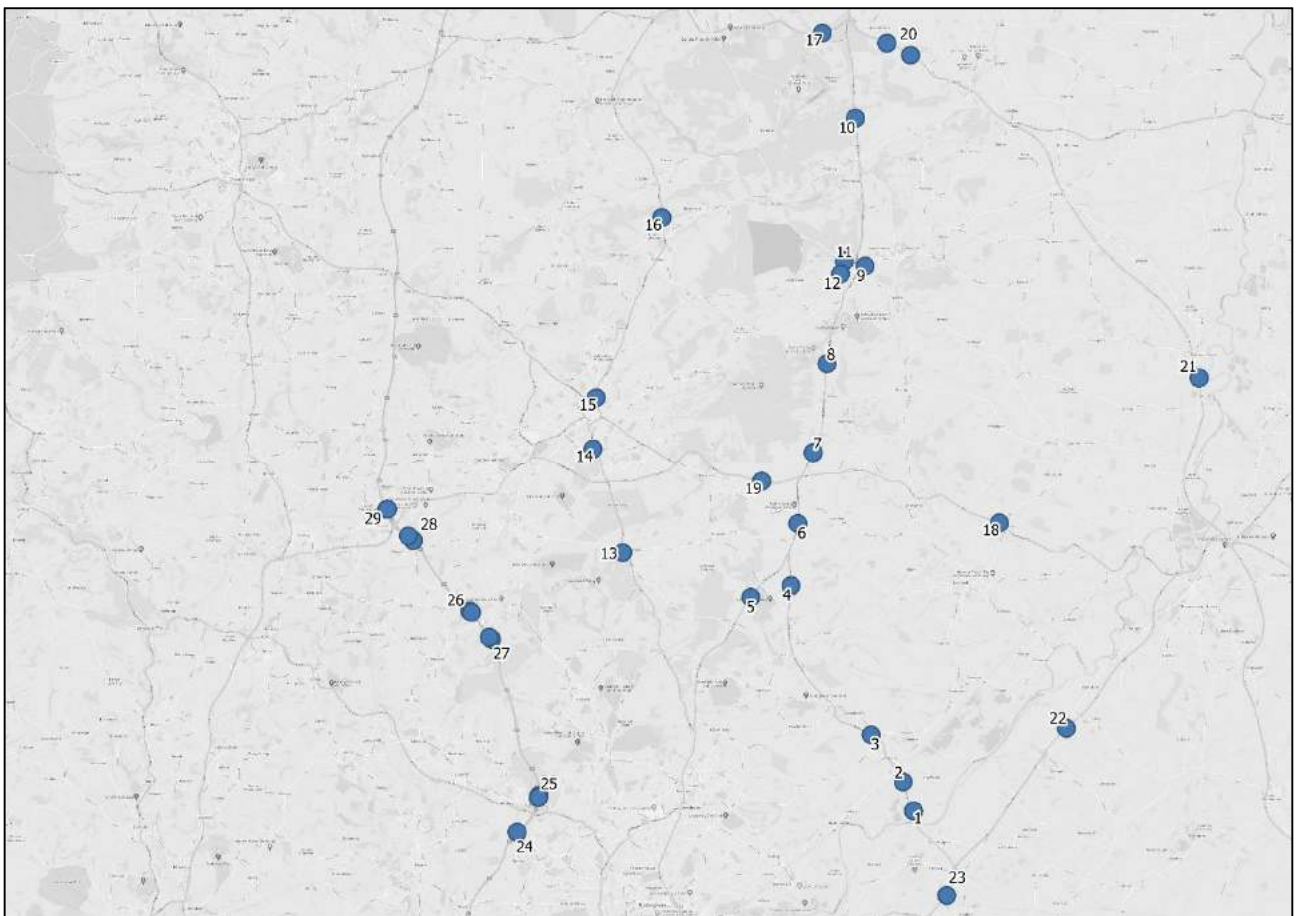

A diagram table showing the various site locations and a map showing their placement is shown below.

**Table 4 - Location of counts**

Location	Site	Date
Gunthorpe	1	Mar-15
South of A612	2	Mar-15
North of A613	3	Mar-15
A6079 South of Warren Head	4	Mar-15
A614 South of Warren Head	5	Mar-15
North of Warren Head/South of A617	6	Mar-15
North of A617	7	Mar-15
A614 South of Ollerton	8	Mar-15
A616 East of Ollerton	9	Mar-15
A614 North of Ollerton	10	Mar-15
A616 Northwest of Ollerton	11	Mar-15
A6075 Southwest of Ollerton	12	Mar-15
A60 South of A617	13	Mar-15
A60 North of A617	14	Mar-15
A60 North of Mansfield	15	Mar-15
A60 South of A616	16	Mar-15
A57 Worksop/A1	17	Mar-15
East of A614	18	Jul-17
West of A614	19	Jun-15
A1 Upper Morton	20	Mar-15
A1 Sutton on Trent	21	Jun-15
A46 Newark on Trent/East Bridgeford	22	Mar-15

A46 Bingham/East Bridgeford	23	Mar-15
South of J26	24	Mar-15
North of J26	25	Mar-15
North of J27	26	Mar-15
South of J27	27	Mar-15
South of J28	28	Mar-17
North of J28	29	Mar-17

**Figure 8 - Location of counts**

There were 29 additional count sites included – which, when taken in either direction, involved a total of 58 counts used as part of this analysis. For most sites, counts for March 2015 (the same as the model base) was obtained. For those sites where March 2015 data could not be obtained one of the following options (ordered) was used:

- The nearest neutral month of data was selected if available;
- March of the closest year to 2015 which could be factored by an NTEM growth factor taken from TEMPRO for car driver and passenger in Nottinghamshire for the relevant peak period; or
- Any remaining date for survey were used applying growth factor as above if necessary.

The validation criteria used comes from TAG (Transport Appraisal Guidance) Unit 3.1 for link flows are defined in the table below.

**Figure 9 - TAG validation criteria (TAG Unit M3.1)**

Criteria	Description of Criteria	Guideline
1	Individual flows within 100 veh/h of counts for flows less than 700 veh/h	> 85% of cases
	Individual flows within 15% of counts for flows from 700 to 2,700 veh/h	
	Individual flows within 400 veh/h of counts for flows more than 2,700 veh/h	
2	GEH < 5 for individual flows	> 85% of cases

Link flows that meet *either* criterion were regarded as satisfactory.

A summary of the number of sites for each time period in the base model that met the TAG validation criteria is shown in the table below.

**Table 5 - Count comparison summary table**

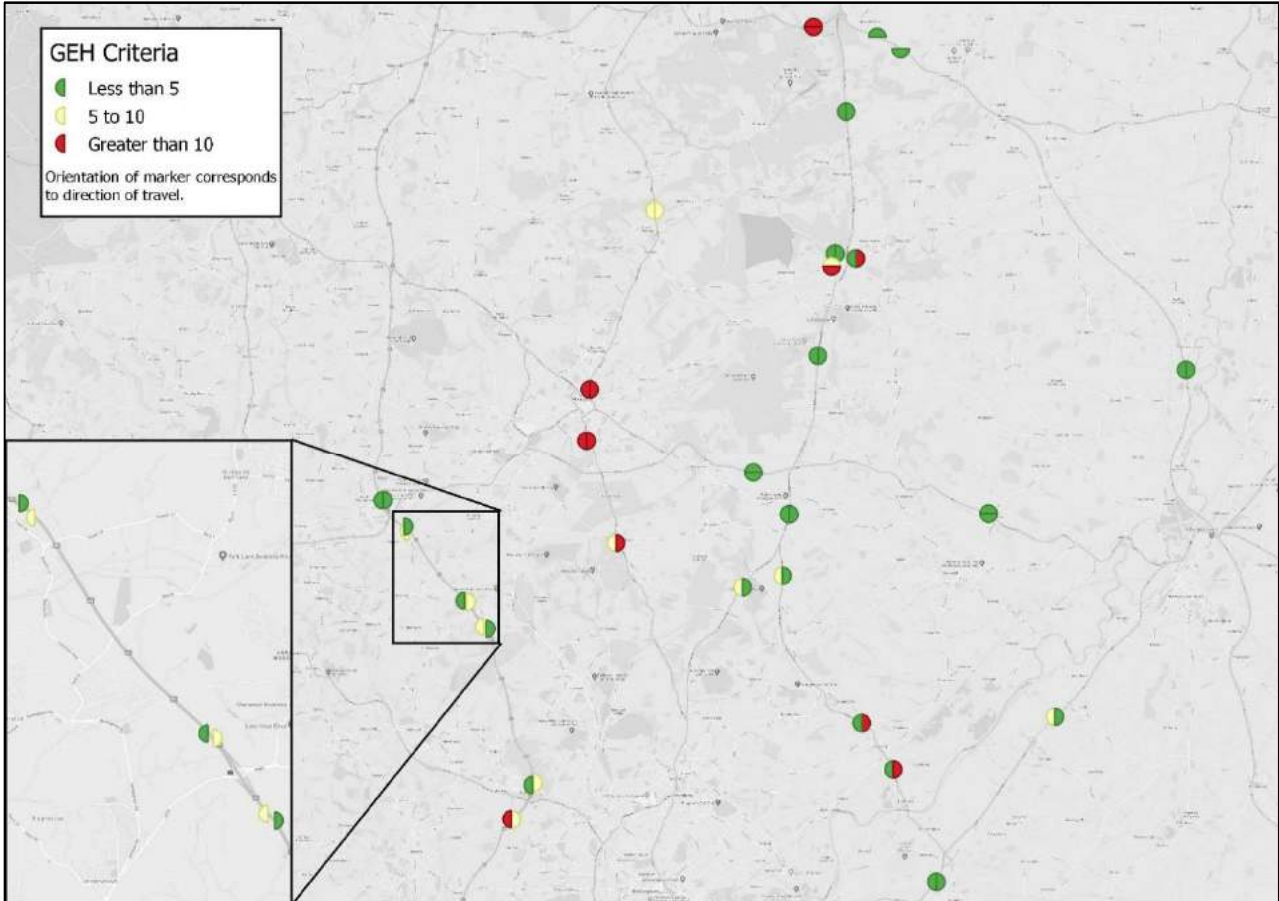

Peak	Sites Meeting Criteria	Total Sites	Total Criteria Met %
AM	33	58	57%
IP	34	58	59%
PM	19	58	33%

The proportion of counts meeting the criteria in this area is low, particularly in the PM peak. It falls short of the TAG acceptability guideline of 85% of cases meeting one of the two criteria in all three peaks.

Full tables showing modelled and observed counts, alongside GEH and flow criteria values, are included in **Appendix A**.

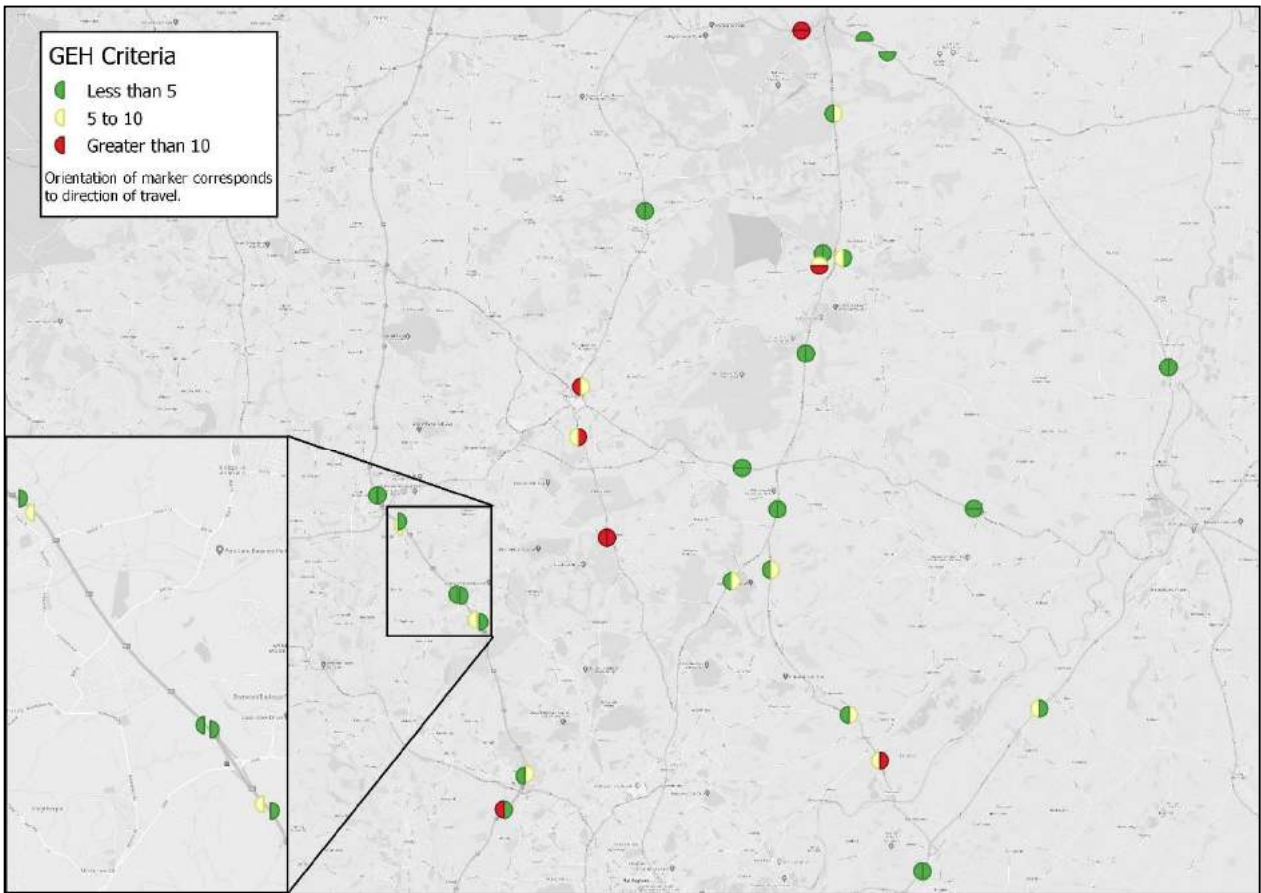

The maps below show the GEH for each site in each time period. Generally, along the scheme corridor, counts have GEH's of below 5 and therefore meet this TAG validation criterion.

**Figure 10 - AM count site GEH's**

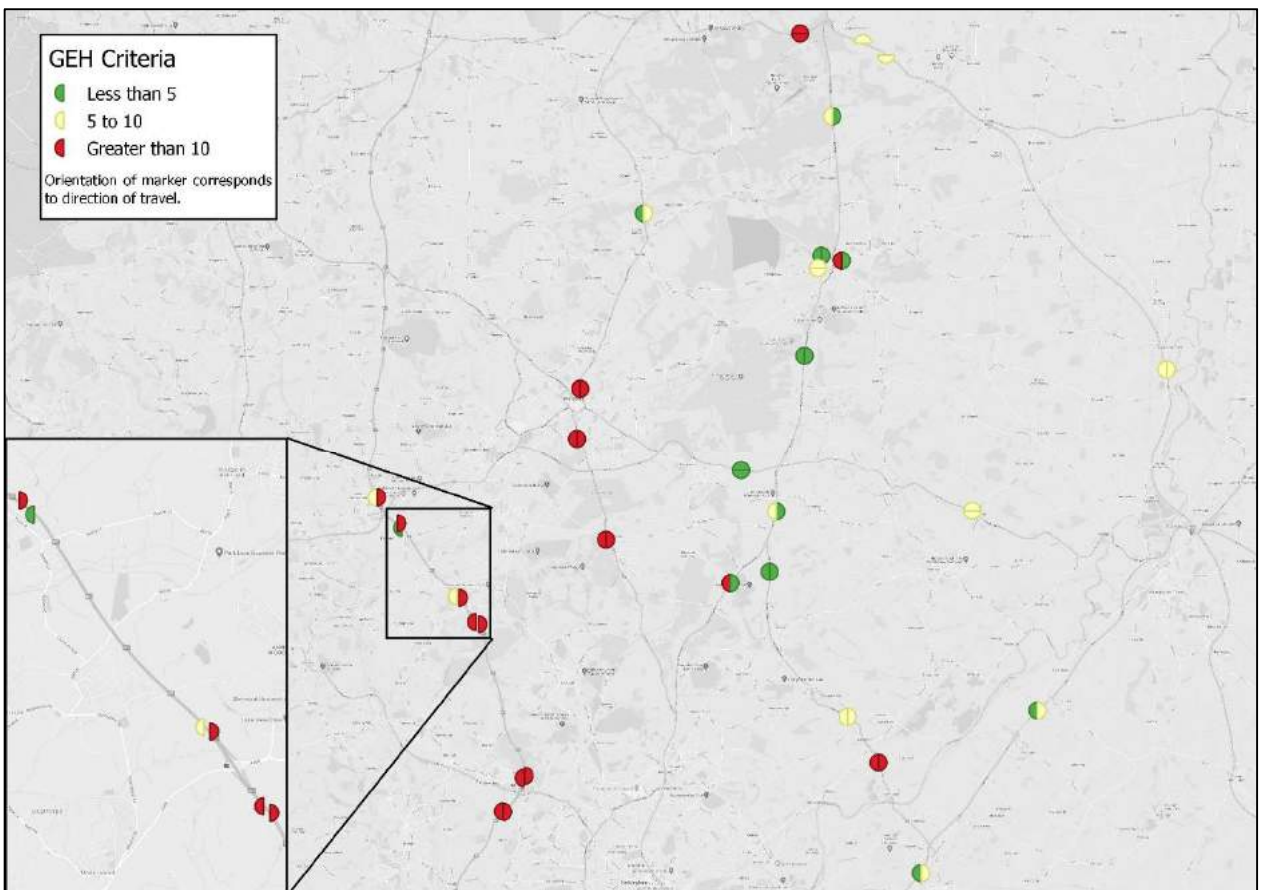

**Figure 11 - IP count site GEH's**

**Figure 12 - PM count site GEH's**

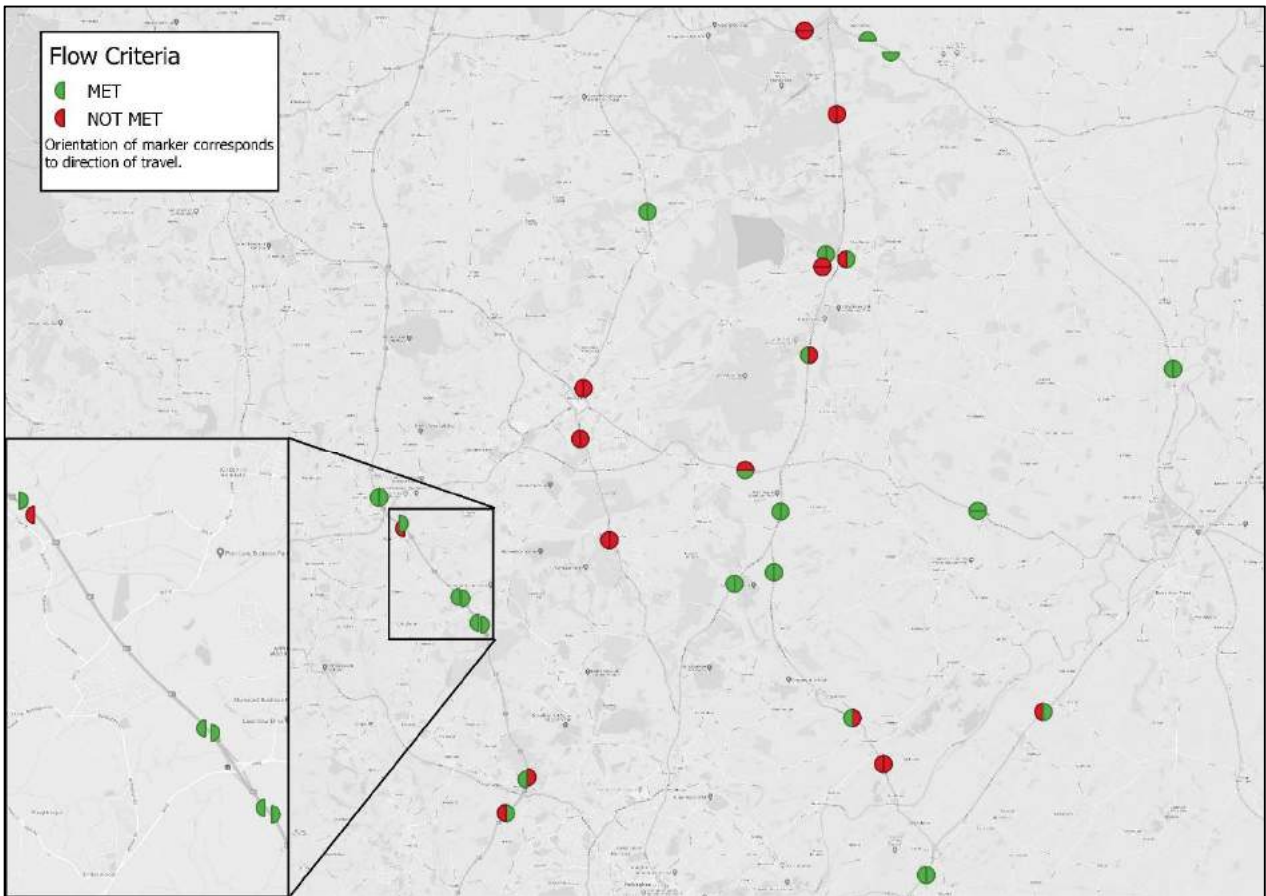

The PM model does not perform as well in this respect as the AM or IP models – with many counts on the scheme corridor having a GEH of between 5 and 10, and others on parallel routes having a GEH of over ten.

The maps below show whether the count has met its relevant flow criteria or not.

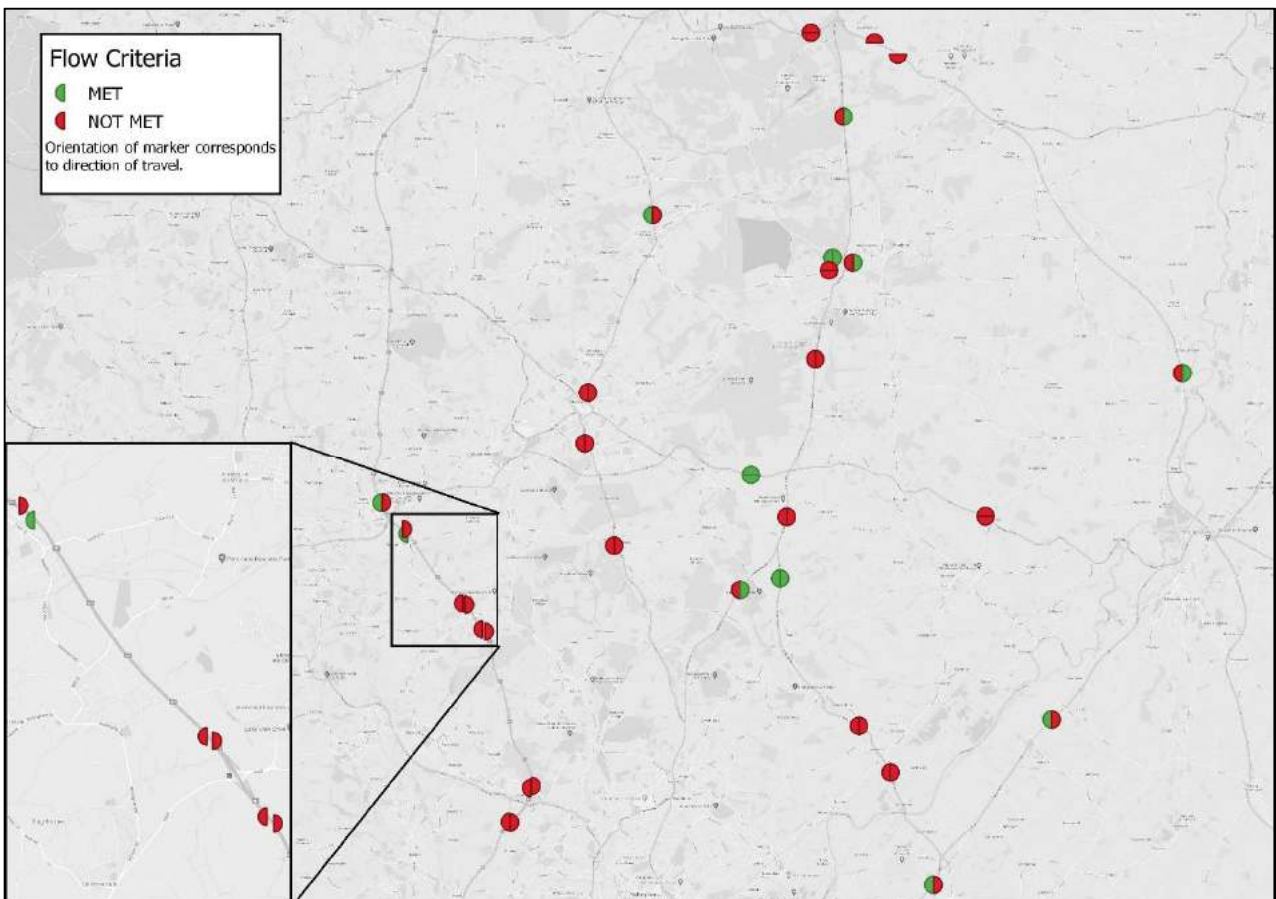

**Figure 13 - AM flow criteria**

**Figure 14 - IP flow criteria**

**Figure 15 - PM flow criteria**

TAG determines suitability if a site meets either one or both of the two criteria detailed above. Hence, the maps below show whether the site meets the criteria by meeting one or both of the criteria, or not.

**Figure 16 - AM criteria summary**

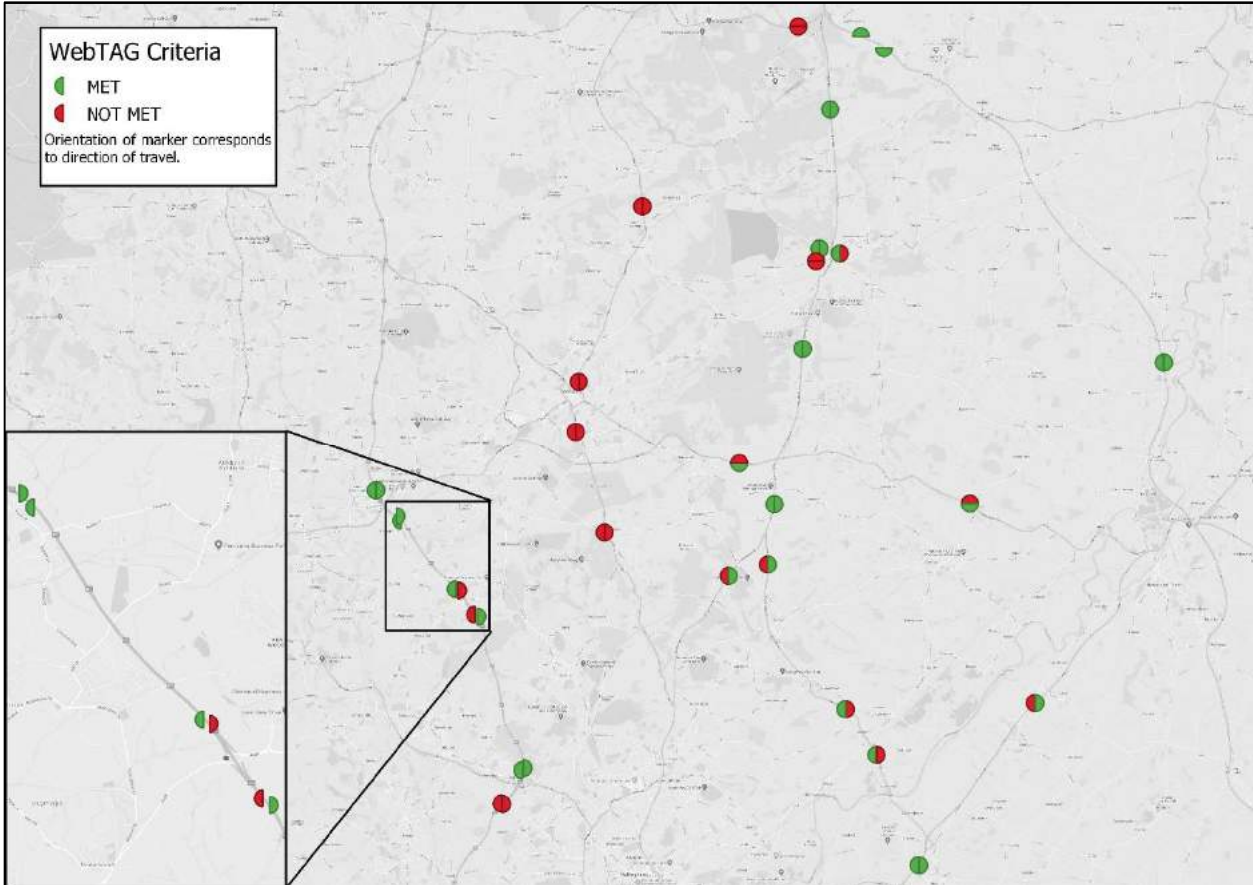

Figure 17 - IP criteria summary

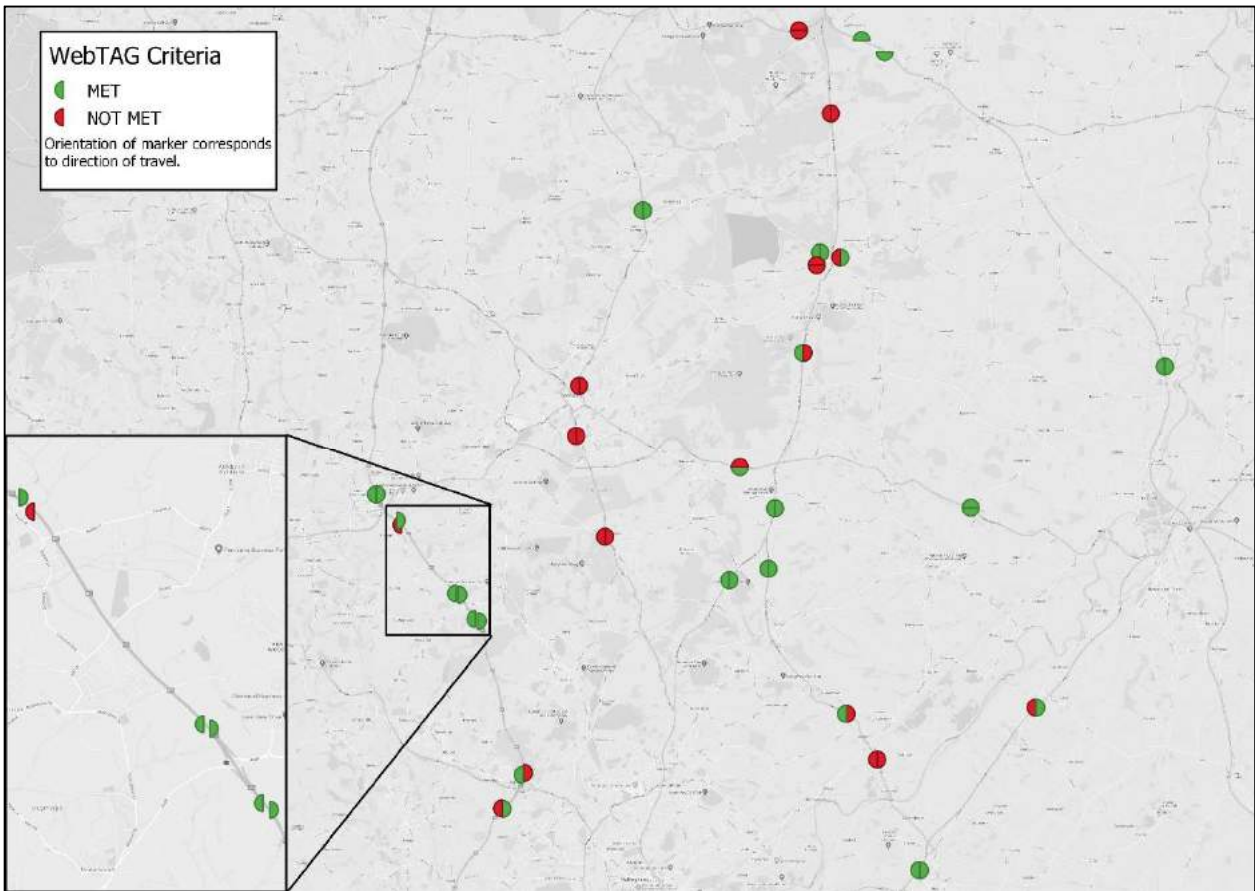

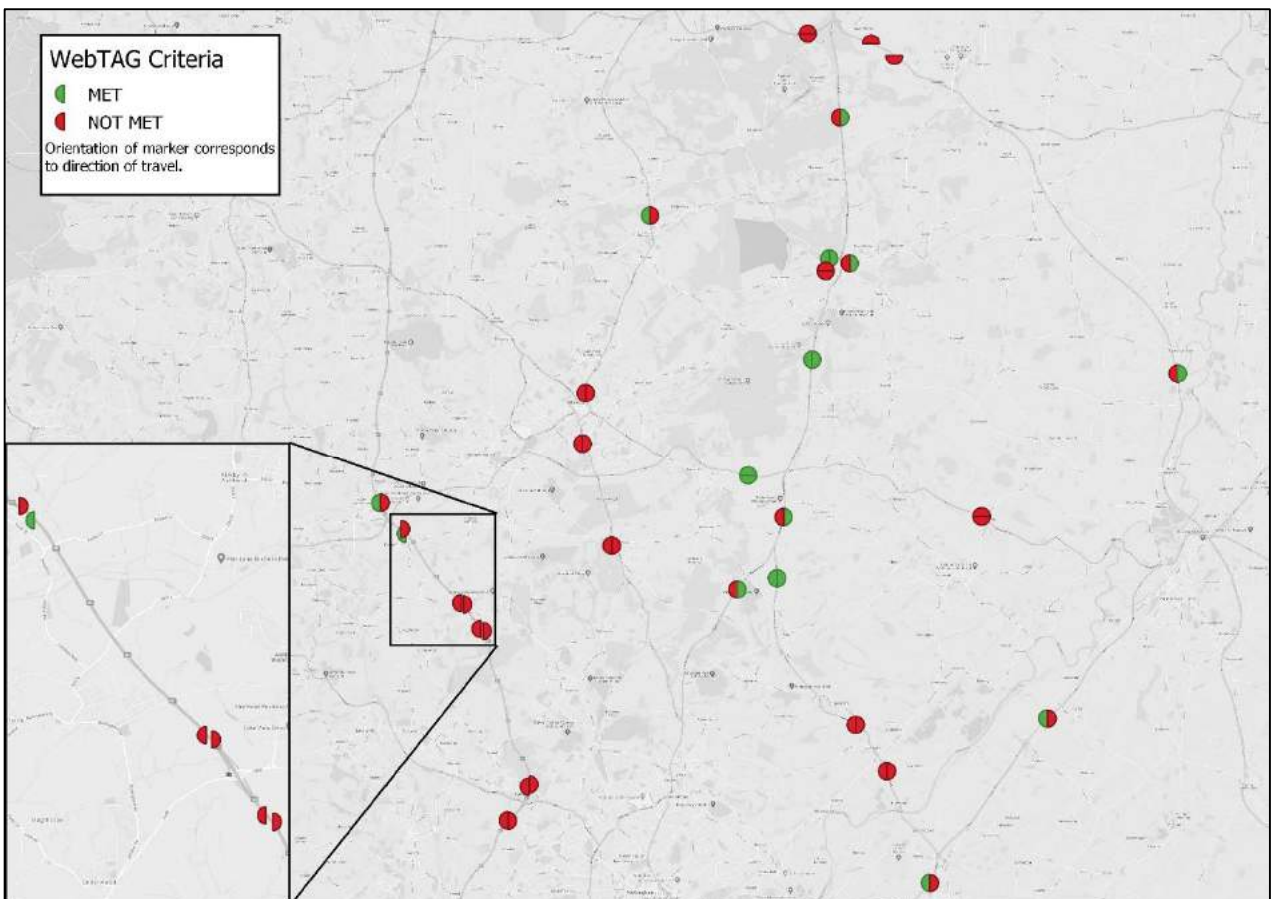

Figure 18- PM criteria summary

The AM and IP models have considerably more sites meeting TAG criteria than the PM model. Generally, across the AM and IP models, many of the sites on the scheme corridor meet the acceptability criteria, as well as the parallel routes on the M1 and A46/A1. The alternative route that does not have sites meeting the acceptability criteria consistently across the three time periods is the A60 through Mansfield – although it should be noted that this is an expected outcome, given that within the Regional Traffic Models, urban areas, such as Mansfield, are coded as fixed speed links, as such may not perform as well during any kind of validation.

## Select Link Analysis

Select link analysis has also been performed upon two links in the base year model, in order to provide assurance around routing choices and patterns around the scheme corridor.

Two links have had this analysis undertaken: the link on the A6097 representing Gunthorpe Bridge, crossing the River Trent, and the link immediately south west the Warren Hill junction on the A614.

The base year AM and PM select link plots for the Gunthorpe Bridge link demand flows are shown below in equivalent passenger car units (PCUs). The scheme corridor is also highlighted in blue dotted lines.

**Figure 19 - Base Year AM Gunthorpe Bridge northbound select link (demand, PCUs)**

**Figure 20 - Base Year AM Gunthorpe Bridge southbound select link (demand, PCUs)**

**Figure 21 - Base Year PM Gunthorpe Bridge northbound select link (demand, PCUs)**

**Figure 22 - Base Year PM Gunthorpe Bridge southbound select link (demand, PCUs)**

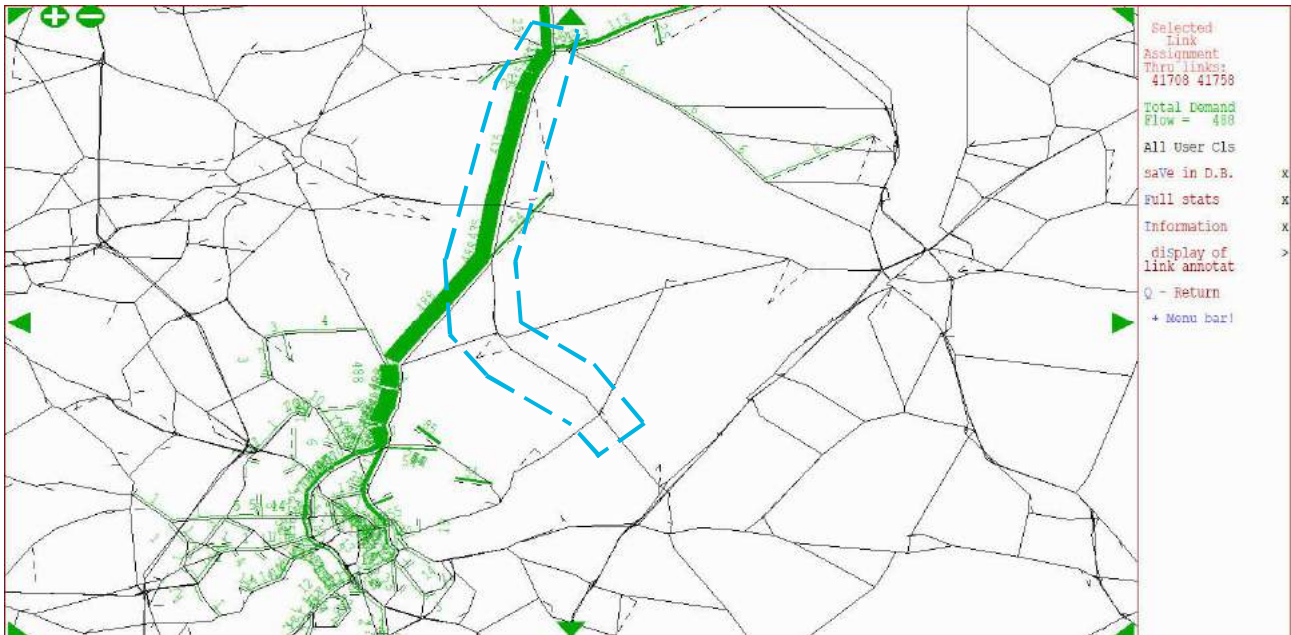

It can be seen in the link plots that traffic demand using this section of the corridor is largely comprised of the following movements:

- south of the River Trent to/from areas along the A46 towards Newark, along the A52 towards Grantham and along the A46 towards Leicester; and
- north of the River Trent to/from Nottingham, Mansfield and to a lesser extent the A1.

Plots for the select link analysis performed on the A614 south west of Warren Hill are shown below. Demand flows are shown below in passenger car units (PCUs). The scheme corridor is also highlighted in blue dotted lines.

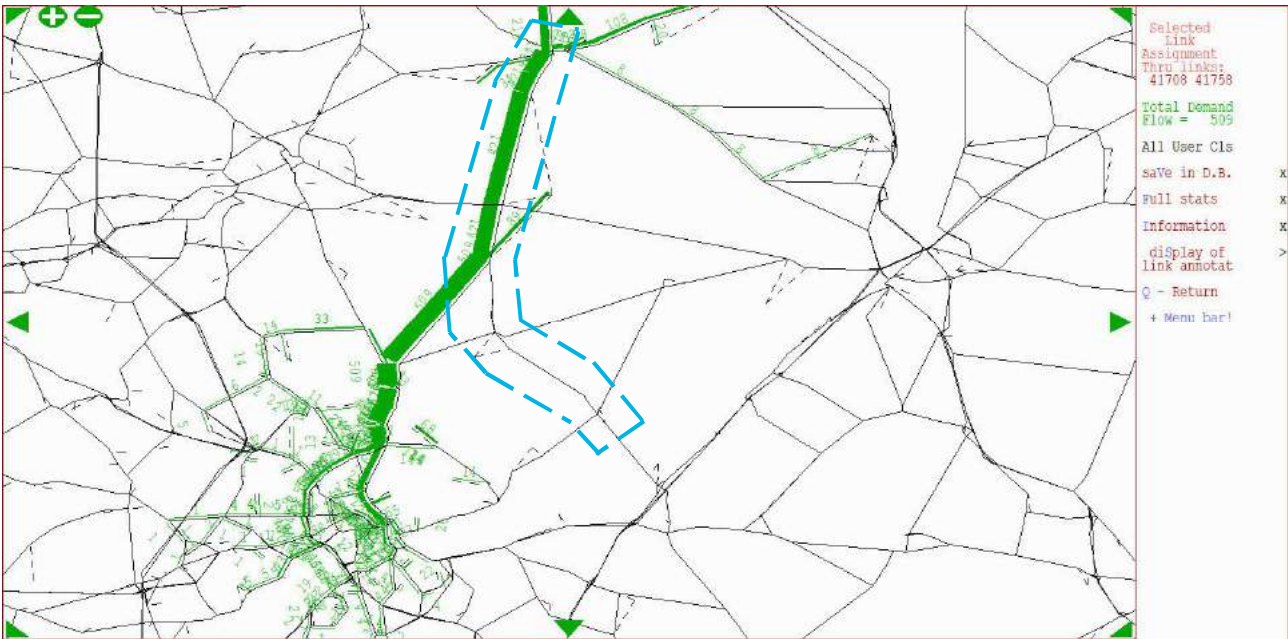

**Figure 23 - Base Year AM A614 northbound select link (demand, PCUs)**

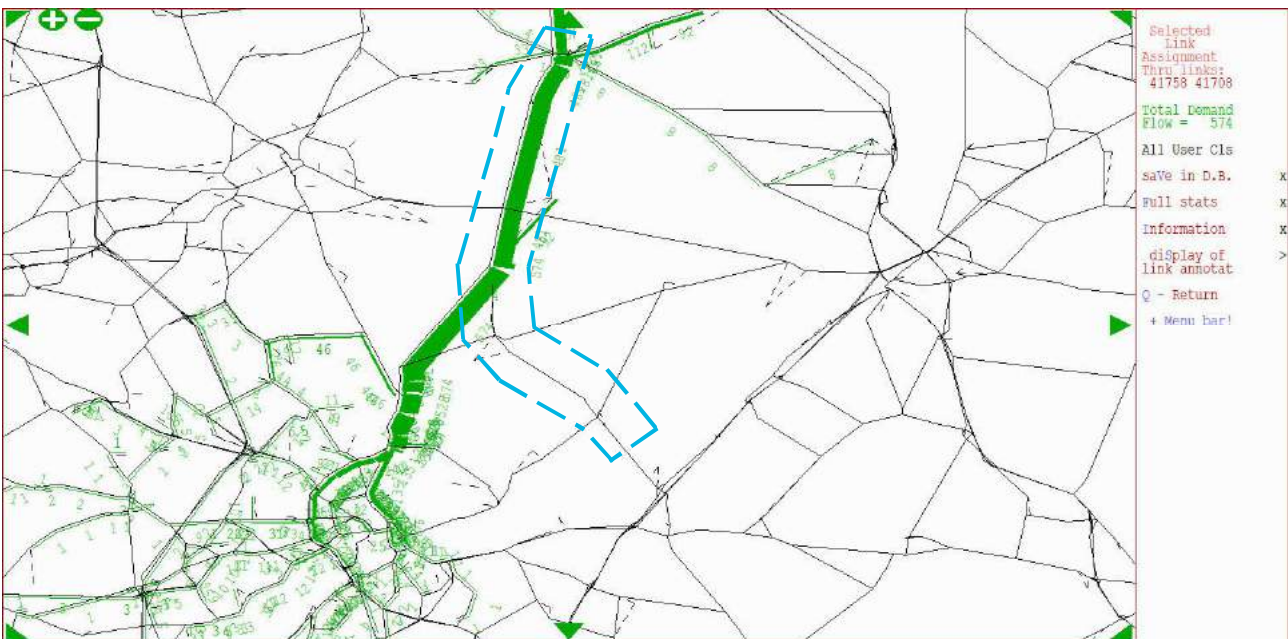

**Figure 24 - Base Year AM A614 southbound select link (demand, PCUs)**

**Figure 25 - Base Year PM A614 northbound select link (demand, PCUs)**

**Figure 26 - Base Year PM A614 southbound select link analysis (demand, PCUs)**

The plots show that most of the traffic using this link is all travelling between the north end of the corridor and Nottingham.

Given the above, route choice in the model is as expected, and demonstrates the lack of route choice for crossing the River Trent.

## Convergence

The table below shows the final line of the convergence summary table of the base year assignments.

**Table 6 - Base year model convergence statistics**

Peak	Loops	Ass.	Sim.	A/S Step	%FLOWS	%DELAYS	%V.I.	%GAP
AM	27	0.0043/16	0.001/ 3	0.528/ 3	99.1	99.5	0.00002	0.0044
IP	18	0.0024/23	0.001/ 4	0.976/ 2	99.3	99.8	0.00000	0.0042
PM	29	0.0033/16	0.002/ 4	0.619/ 2	99.0	99.5	0.00002	0.0037

The model converges in 27 loops in the AM peak, 18 loops in the IP peak and 29 loops in the PM peak. The percentage change in flows and delays in the model are over 99% across the board for the final loop. The changes in flow and delay for the final four loops in each time period are shown in the table below.

**Table 7 - Flow and delay changes in final four loops of assignment**

	AM % Flows	AM % Delays	IP % Flows	IP % Delays	PM % Flows	PM % Delays
Loop N-3	99.2	99.5	99.2	99.8	99.1	99.6
Loop N-2	99.0	99.4	99.4	99.8	99.2	99.5
Loop N-1	99.2	99.4	99.3	99.8	99.3	99.5
Final loop (N)	99.1	99.5	99.3	99.8	99.0	99.5

This shows a demonstrates a good level of convergence for a strategic model covering a large geographical area. The model shows notably strong stability in terms of delay over the final four loops of the assignment and meets TAG criteria of need four consecutive iterations that are greater than 98%.

## Summary

- The model as a whole performs well in terms of its validation on major links including motorways and the strategic road network.
- Validation has particular 'challenges' along the scheme corridor and nearby competing routes given the use of spider connectors for traffic to leave and enter the network and zones. In particular, there is a zone with three spider connectors for entry and exit joining on to the network directly on to the scheme corridor.
- However, along the scheme corridor, the modelled journey times compare reasonably well to the observed journey times and are within the TAG acceptability criteria.
- Model convergence is suitable and presents no issues for the use of the model for the purpose proposed.
- The MCHM model is suitable for use in the proposed sensitivity tests but does not contain sufficient detail along the A614/A6097 corridor to support scheme appraisal directly.

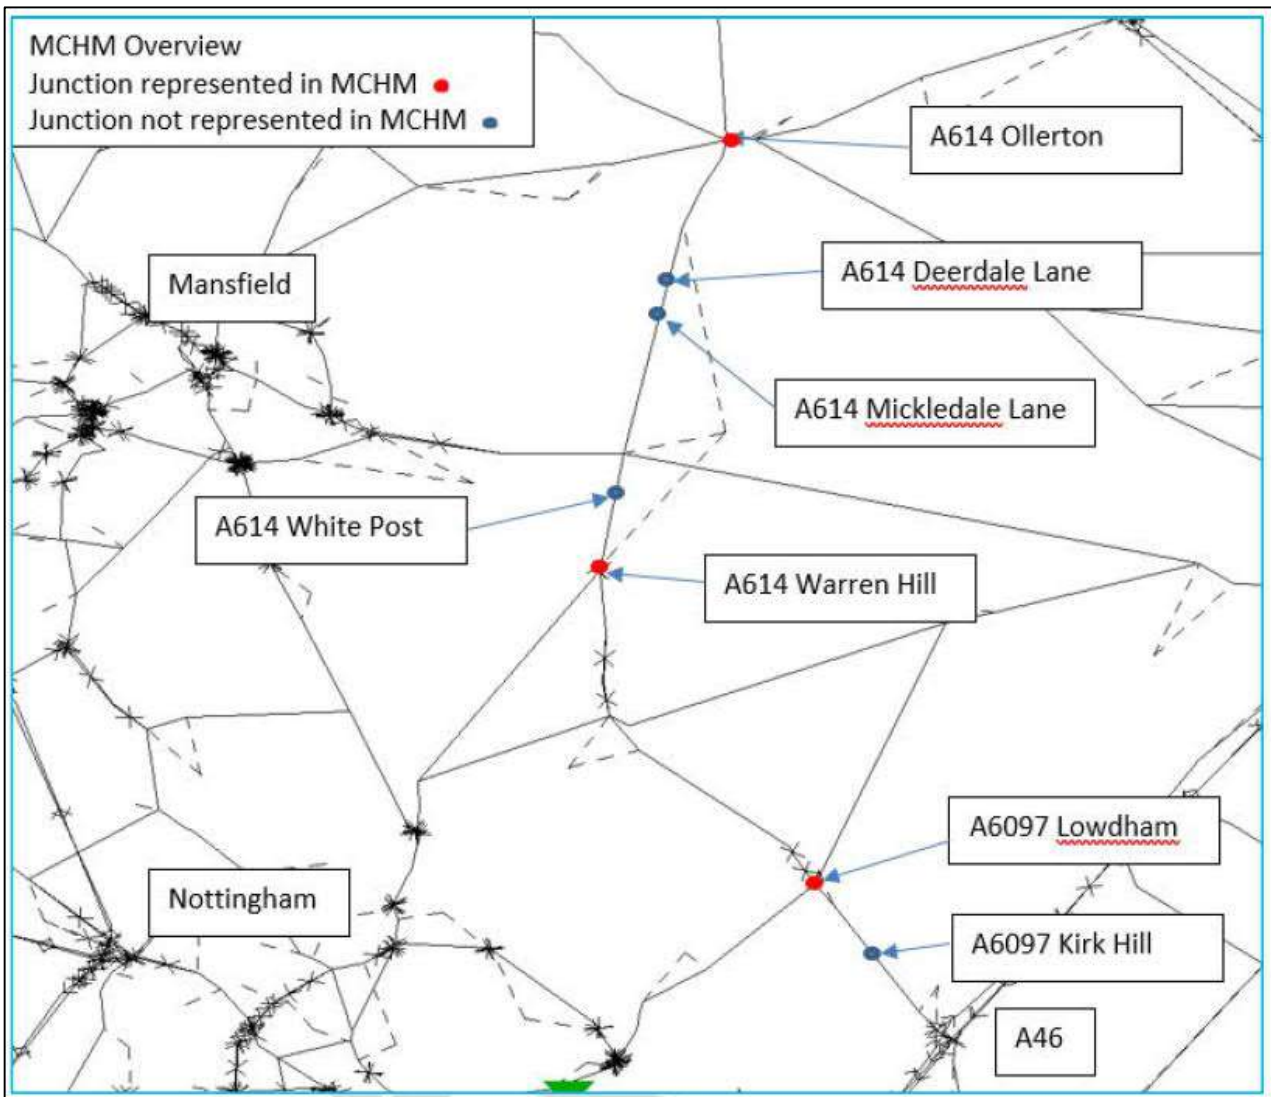

# Model Runs

## Methodology

### Improvements Coding

The plot below shows the junctions being improved and their location in the MCHM SATURN model.

**Figure 27 - Model Overview Plot**

As is shown above, only three of the seven junctions being improved as part of the scheme are included within the model. The table below describes the approach taken to simulating these in the model:

**Figure 28 - Model Coding Summary**

Junction	Status in Model	Approach
A614 Ollerton	Represented	Capacity improvements directly coded at this node.
A614 Deerdale Lane	Not represented	'Time penalty' coded onto the link to represent additional delay from adding a signal junction.
A614 Mickledale Lane	Not represented	'Time penalty' coded onto the link to represent additional delay from adding a signal junction
A614 White Post	Not represented	This is a white lining and safety scheme where there is no perceived change to journey times, and hence this element was not coded into the model.
A614 Warren Hill	Represented	Junction configuration changed to simulate an exploded roundabout junction.
A6097 Lowdham	Represented	Capacity improvements directly coded at this node.
A6097 Kirk Hill	Not represented	Alterations made to the speed / flow curve on the link to represent the time savings due to the extra capacity and reduced delay at this signalised junction.

Detail of the specifics of the updates to the junction coding / representation is given below.

- Ollerton and Lowdham – both are represented as roundabout nodes in the MCHM SATURN model. Hence, to simulate the improvements, the entry saturation flows and circulating capacities were increased, and gap acceptance shortened, where relevant and in line with the Regional Transport Model Coding Manual.
- Warren Hill – the junction is represented as a series of give way junctions. This was converted into an 'exploded' roundabout junction (i.e. linked 'give-way' junctions), in line with the guidance from the Regional Transport Model Coding Manual.
- Deerdale Lane and Mickledale Lane – these junctions are not explicitly represented in the model. Hence, additional delay as a result of signalisation was taken from the Linsig junction modelling for each of the two junctions, aggregated, and applied as a time penalty on the link where the junctions were located.
- Kirk Hill – this junction is also not represented in the model. The improvement is forecast to result in a reduction of delay. The time saving drawn from the Linsig junction modelling has been used to calculate the average increase in speed over the whole link where the junction is located, and the speed flow curve for that link altered appropriately – hence, 2kph has been added to the free flow and at-capacity speed for the relevant speed flow curve on that link.

## Fixed Demand Modelling

A number of fixed demand model run assignments were carried out in the first instance, in order to check the rerouting impacts of the scheme. There were three tests carried out, each building on top of the previous one, in order to assess the impact of the re-routing impact of the various scheme elements. The tests included the following components:

- Test 1: Improvements coded-in to the Ollerton, Warren Hill and Lowdham junctions (i.e. the junctions explicitly represented in the model).
- Test 2: Elements from Test 1, plus a 'time penalty' coded on a link to represent the combined delay from inserting signal junctions at Mickledale Road and Deerdale Lane (junctions not represented in the model, which would increase overall journey time).
- Test 3: Elements from both Test 1 and Test 2, plus an increase in speed coded in to the speed flow curve on the link to represent the junction with Kirk Hill having extra lanes and capacity added to it (junctions not coded in to the model, where the change would elicit an overall journey time saving along the link).

The above tests were carried out in the 2026, 2031 and 2041 future year MCHM. The reassignment tests for 2031 are present in the following sections and the runs undertaken for 2026 and 2041 are summarised in **Appendix B**.

The expected result is that there would be minimal rerouting, given the nature of the scheme and the lack of alternative route choice for crossing the River Trent through Nottingham and to the east of Nottingham.

## Variable Demand Modelling

The network for Test 3 (including simulations of all parts of the schemes) was then carried forward, in order to be tested using Variable Demand Modelling (VDM). A VDM run was performed for 2031 only.

The expected result is that the VDM will have minimal impact. The scheme corridor is a rural route, where the dominant mode is car, and it is not anticipated that the scheme would elicit any material mode change from public transport. It should be noted that goods vehicle elements of the matrix remain fixed as part of the VDM process.

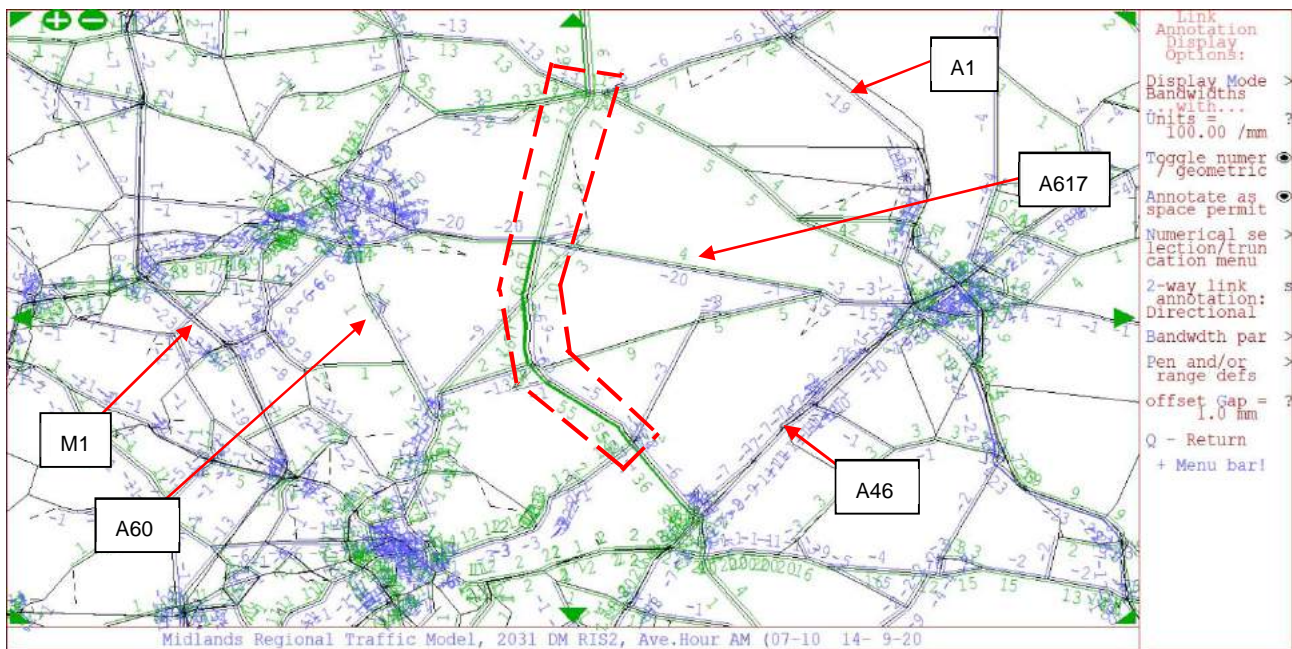

# Results

## Fixed Demand Modelling

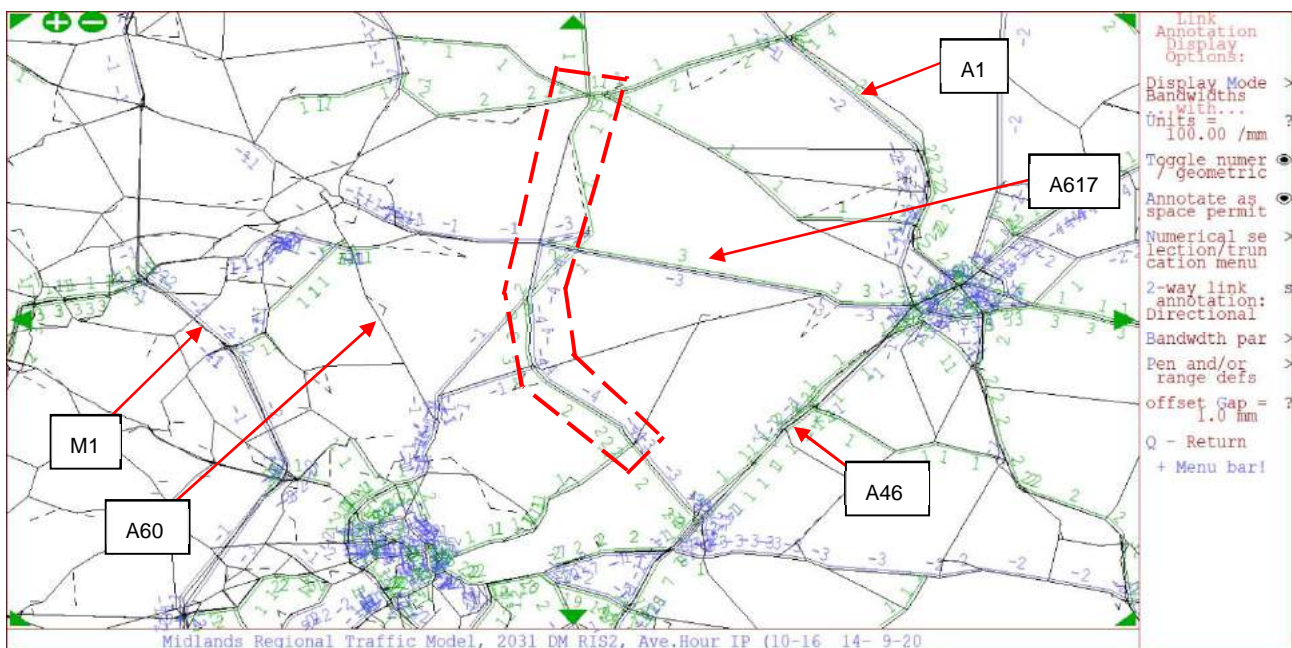

Results for the fixed assignment, for the year 2031, are shown below. Equivalent plots for the other forecast years (2026 and 2041) and other fixed demand tests, are included as appendices.

The following plots, from the SATURN model, show the demand flow difference between the do-minimum and Test 1 scenario. Green bandwidths indicate an increase, while blue indicate a decrease. The scheme corridor and other main routes are marked.

**Figure 29 - 2031 AM Demand Flow Difference (Test 1)**

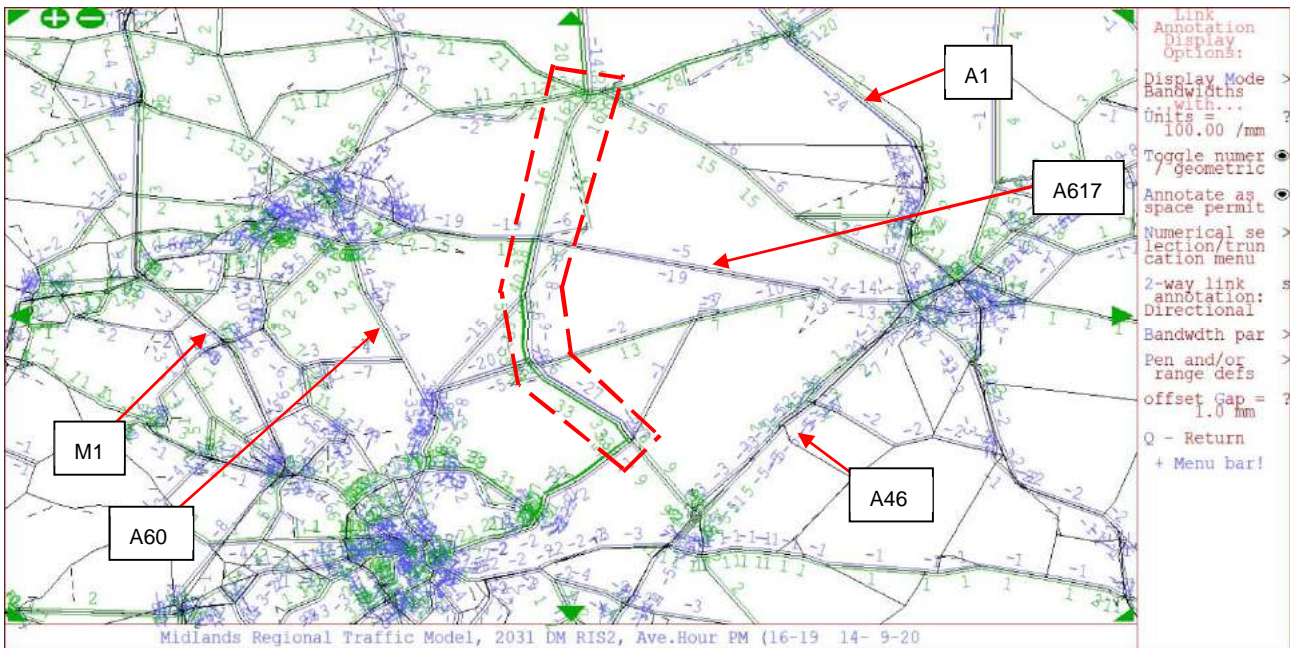

**Figure 30 - 2031 IP Demand Flow Difference (Test 1)**

**Figure 31 - 2031 PM Demand Flow Difference (Test 1)**

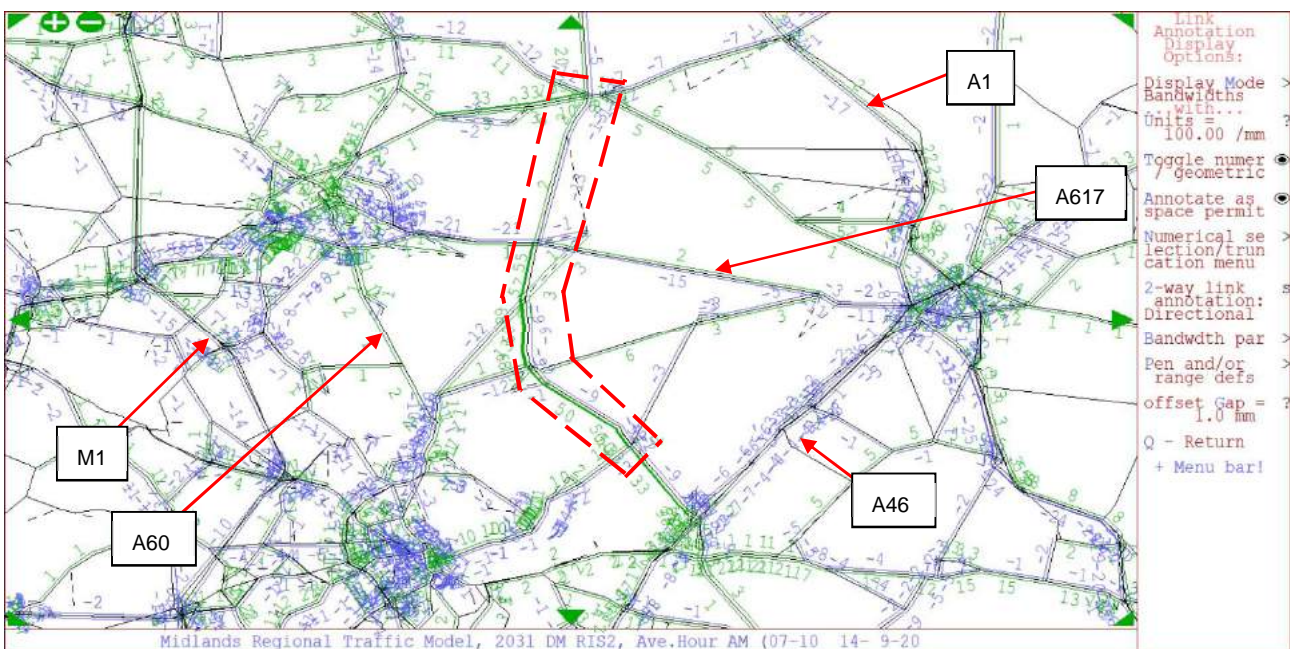

Changes are more prevalent northbound than southbound. This is particularly due to the changes at the Warren Hill junction. Northbound movements from the A6097 to the A616 must wait at two priority junctions given the current configuration. Given the layout is to be changed to a roundabout, there is now only one give way line for this movement.

Conversely, movements in the opposite southbound direction currently have no give way lines to stop at when moving from the A616 to the A6097 under the existing configuration. There is a give way line introduced for this movement under the proposal to change the junction into a conventional roundabout.

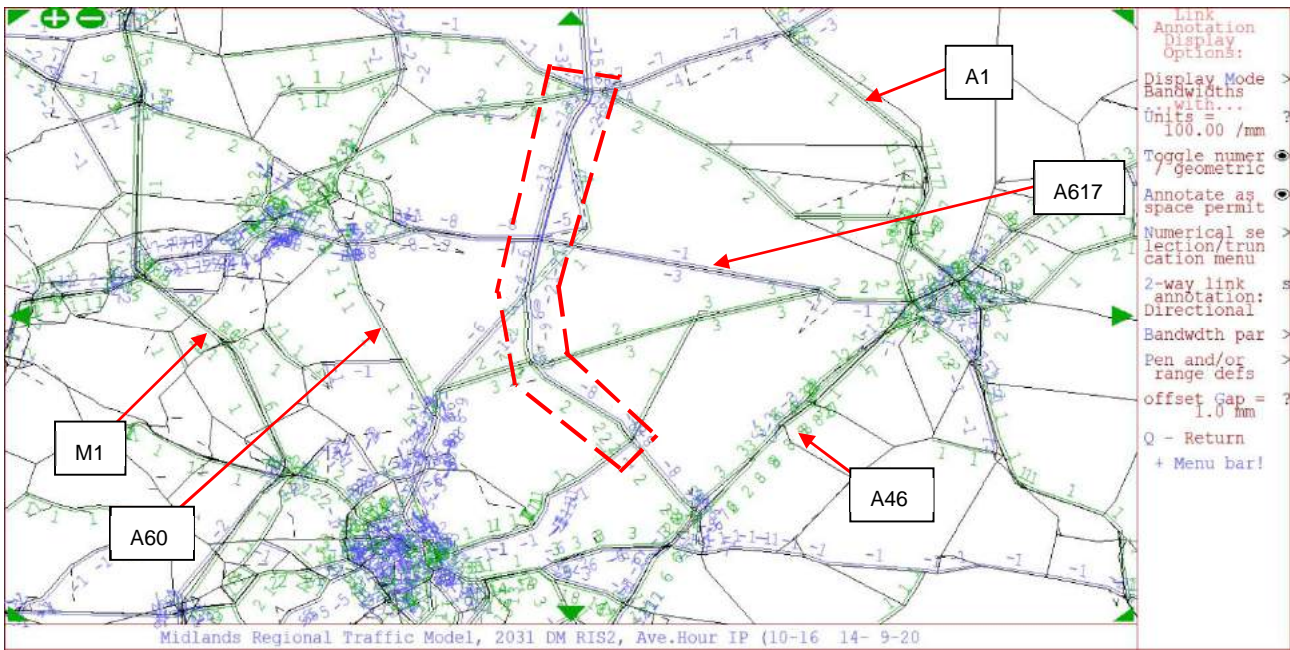

The following plots, from the SATURN model, show the demand flow difference between the do-minimum and Test 2 scenario. Green bandwidths indicate an increase, while blue indicate a decrease.

**Figure 32 - 2031 AM Demand Flow Difference (Test 2)**

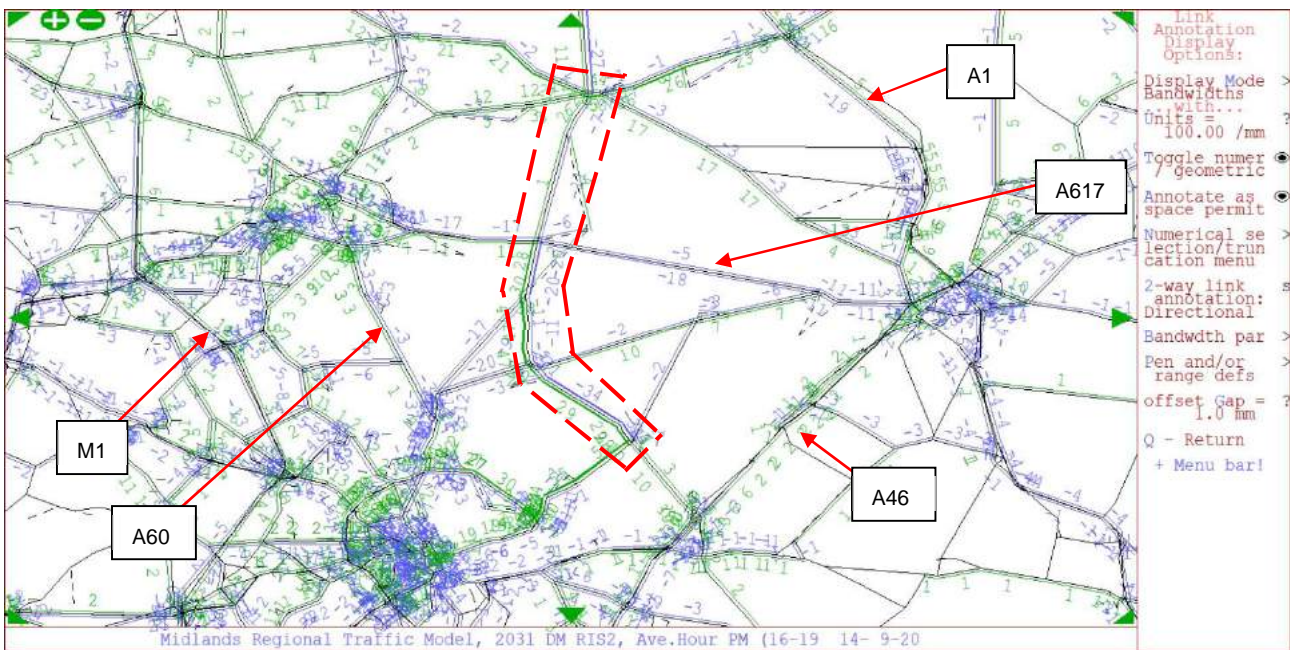

**Figure 33 - 2031 IP Demand Flow Difference (Test 2)**

**Figure 34 - 2031 PM Demand Flow Difference (Test 2)**

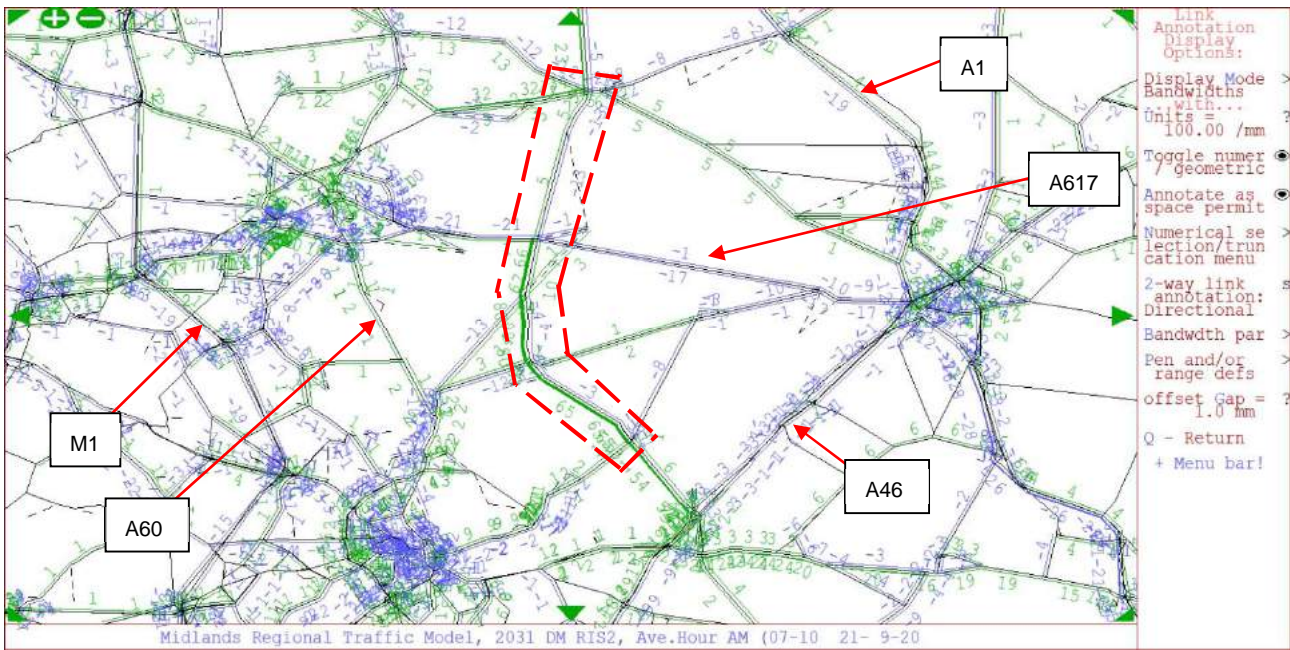

While impacts from Test 1 remain prevalent, the time penalties added to simulate extra delay at the junctions with Mickledale Lane and Deerdale Lane appear to make no material difference to flows on that section of the scheme corridor.

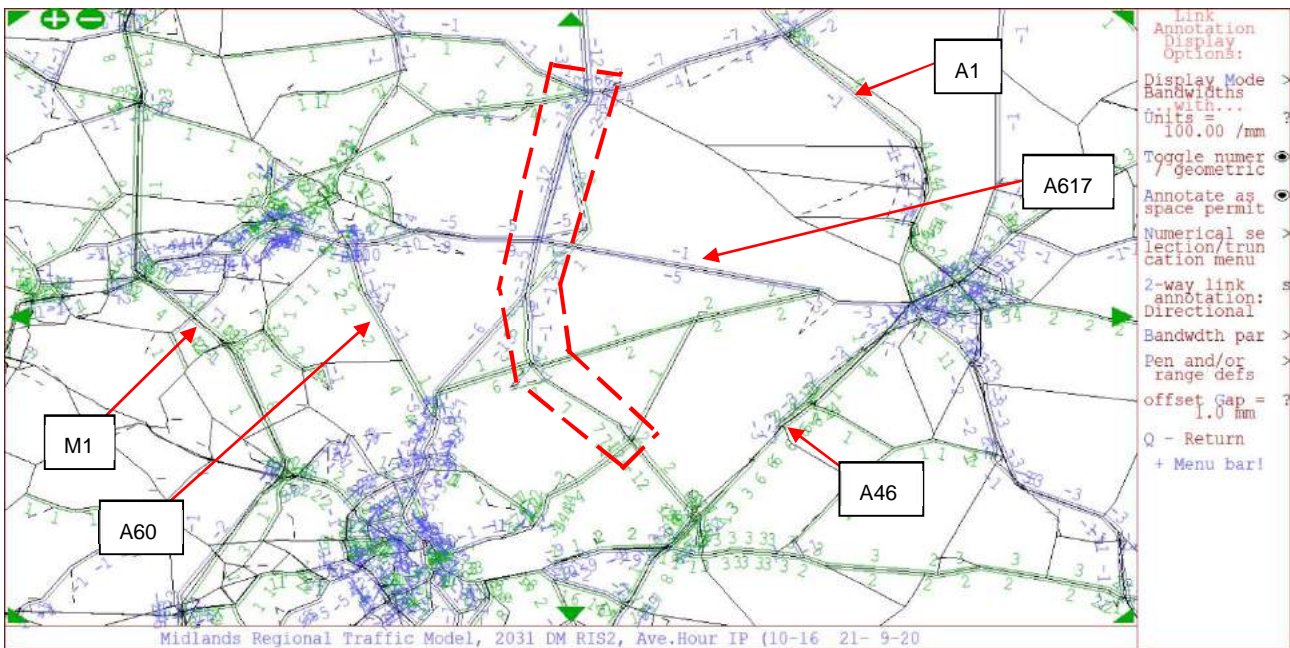

The following plots, from the SATURN model, show the demand flow difference between the do-minimum and Test 3 scenario. Green bandwidths indicate an increase, while blue indicate a decrease.

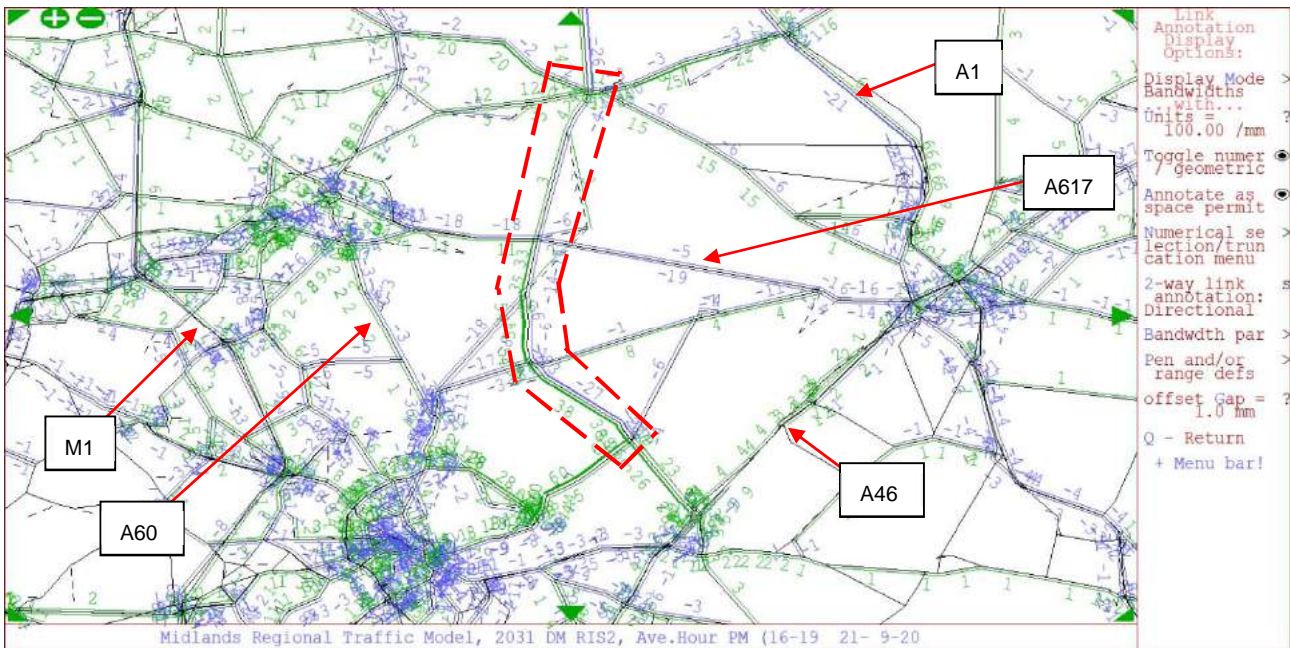

**Figure 35 - 2031 AM Demand Flow Difference (Test 3)**

**Figure 36 - 2031 IP Demand Flow Difference (Test 3)**

**Figure 37 - 2031 PM Demand Flow Difference (Test 3)**

In the AM peak, the largest differences along the scheme corridor are in the range of 60-70 equivalent passenger car units (PCUs) per hour. In the PM, they are in the region of 30-40 pcus/hr. In the inter-peak period, flow changes are less than 20 pcus/hr in all cases. These differences are not considered material.

Impacts from Test 1 and Test 2 still remain prevalent.

There is no clear rerouting on to the scheme corridor from parallel corridors such as the M1, A46/A1, or the A60.

There is a very small amount of re-routing for traffic leaving Nottingham, from the A616 to the A612, which is then joining the scheme corridor at Lowdham. This is due to two factors: firstly, that a give way line on the northbound A616 movement is introduced when implementing a roundabout at Warren Hill, and secondly, that amendments to the capacity on the A612 arm of the Lowdham roundabout cause a decrease in delay on that arm.

In order to give an impression of the scale of the changes, the tables shown below show the demand flow on six key links along the scheme corridor numerically for each fixed demand test variant, alongside the percentage change from the do-minimum, for the AM and PM peaks.

**Table 8 - 2031 AM Northbound key link demand flows (PCUs)**

Location		DM	Test 1	Diff to DM	Test 2	Diff to DM	Test 3	Diff to DM
A6097 Gunthorpe Bridge	NB	1,106	1,142	3%	1,139	3%	1,160	5%
A6097 North of Lowdham	NB	654	709	8%	704	8%	719	10%

A614 Bilsthorpe	NB	914	930	2%	916	0%	917	0%
A614 North of Ollerton	NB	532	552	4%	543	2%	546	3%

**Table 11 - 2031 PM Southbound key link demand flows (PCUs)**

Location		DM	Test 1	Diff to DM	Test 2	Diff to DM	Test 3	Diff to DM
A6097 Gunthorpe Bridge	SB	754	763	1%	757	0%	776	3%
A6097 North of Lowdham	SB	580	553	-5%	546	-6%	553	-5%
A6097 Oxtun Bypass	SB	454	448	-1%	443	-2%	448	-1%
A614 White Post	SB	952	943	-1%	932	-2%	937	-2%
A614 Bilsthorpe	SB	870	883	1%	859	-1%	863	-1%
A614 North of Ollerton	SB	656	642	-2%	628	-4%	630	-4%

The tables demonstrate that the scale of absolute changes noted on the difference plots are very small in the context of the total flows on the links. The largest changes from the do-minimum in percentage terms are on the northbound A6097 Oxtun Bypass – this is approaching the Warren Hill junction. It is expected that the most significant changes will happen here because of the change in priorities entailed by the improvements, explained above.

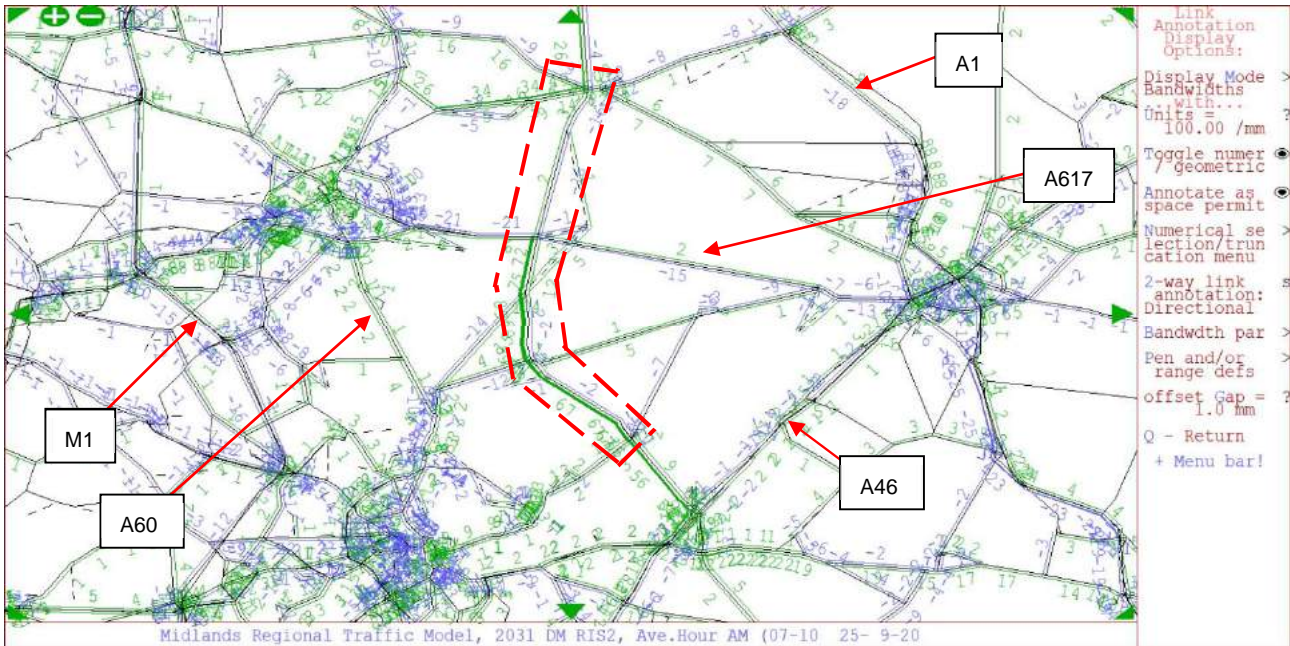

Outside of that, any changes in demand on these particular links are less than 7%. As noted in the plots, southbound changes are far smaller than those going northbound.

## Variable Demand Modelling

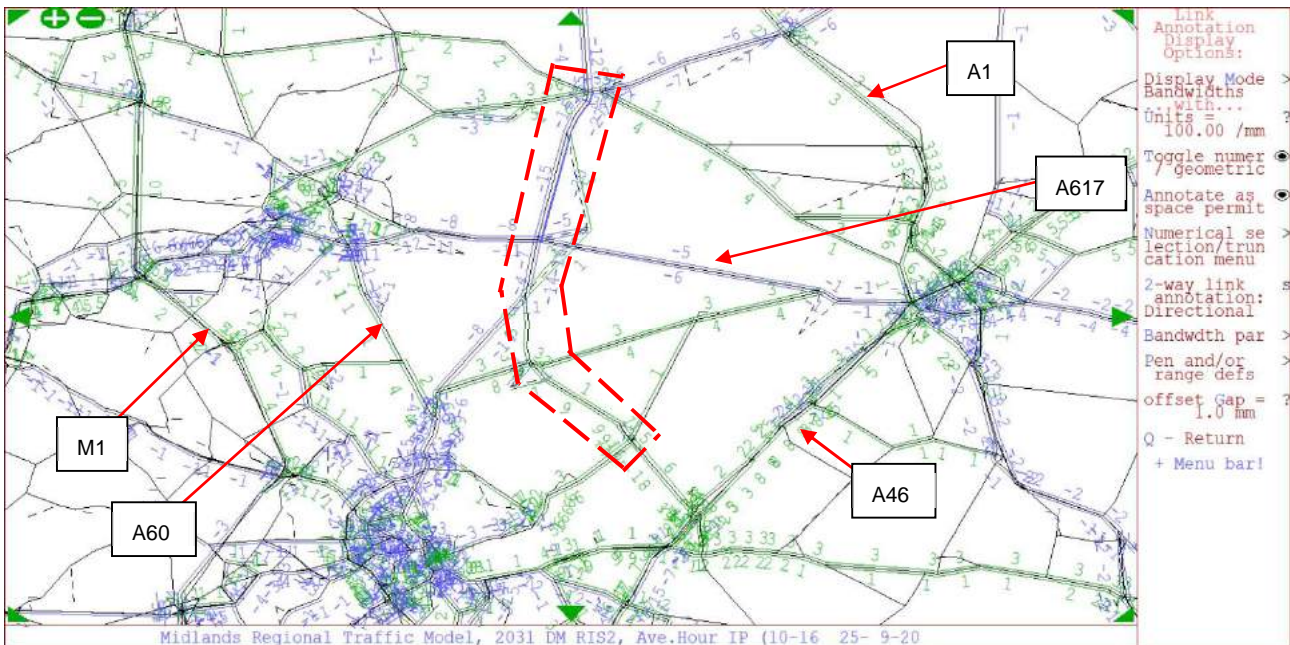

Another test was carried out using matrices that had been put through the variable demand modelling process, on the basis of the network used for fixed assignment Test 3.

Difference plots for the VDM test against the do-minimum test are shown below. The scheme corridor and other main routes are marked.

**Figure 38 - 2031 AM demand flow difference plot (VDM Test)**

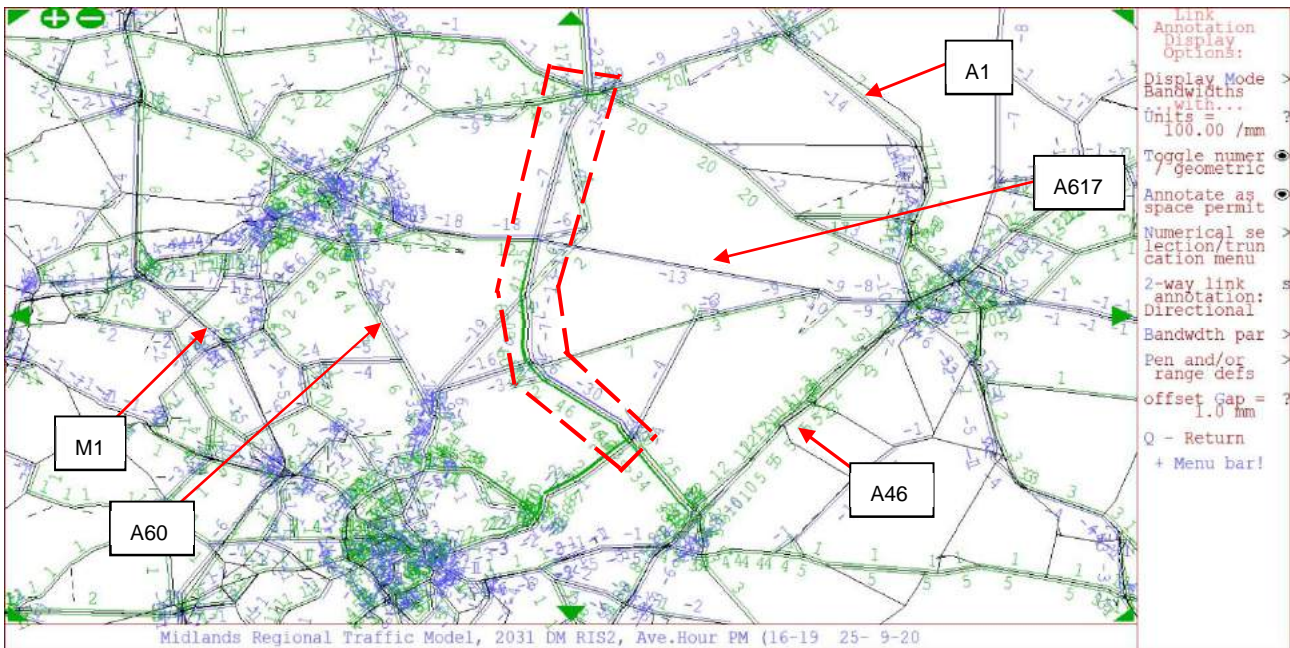

**Figure 39 - 2031 IP demand flow difference (VDM Test)**

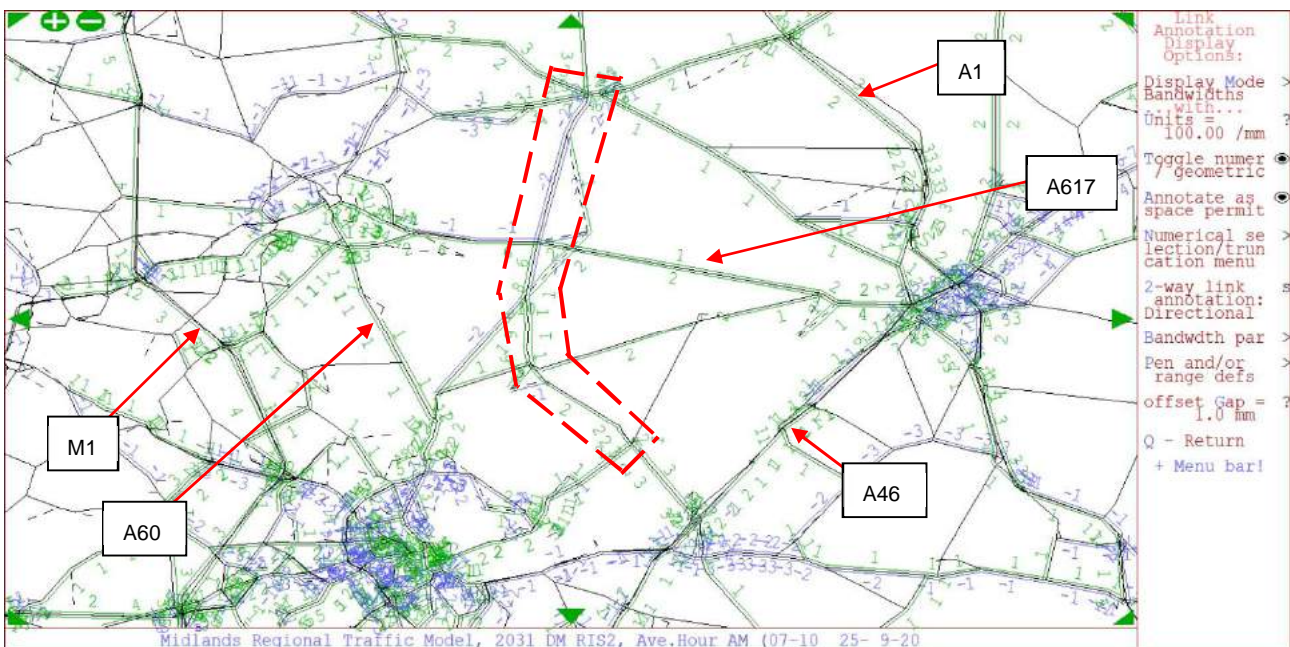

**Figure 40 - 2031 PM demand flow difference (VDM Test)**

These plots show a type and scale of difference which is very much comparable to the fixed demand assignment results.

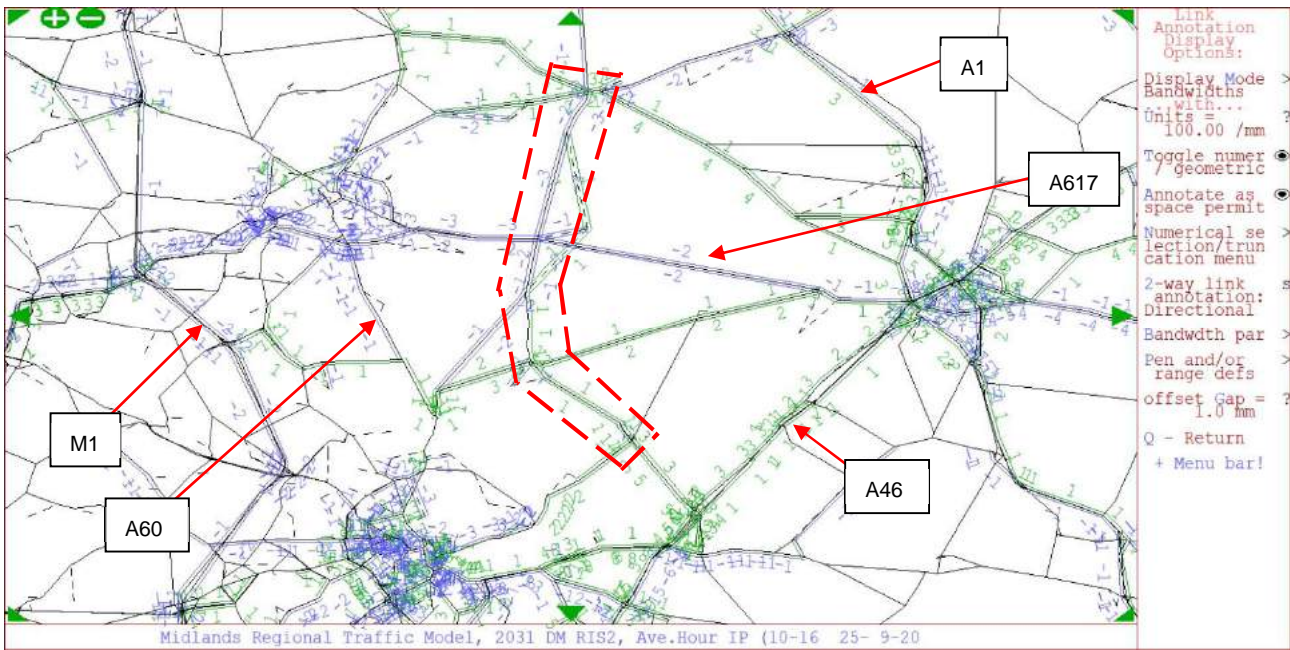

To demonstrate the impact of the VDM process, difference plots have been extracted to show the change between assignments using the pre (Test 3 fixed assignment) and post VDM matrices.

**Figure 41 – 2031 AM Pre vs Post VDM demand flow difference plot**

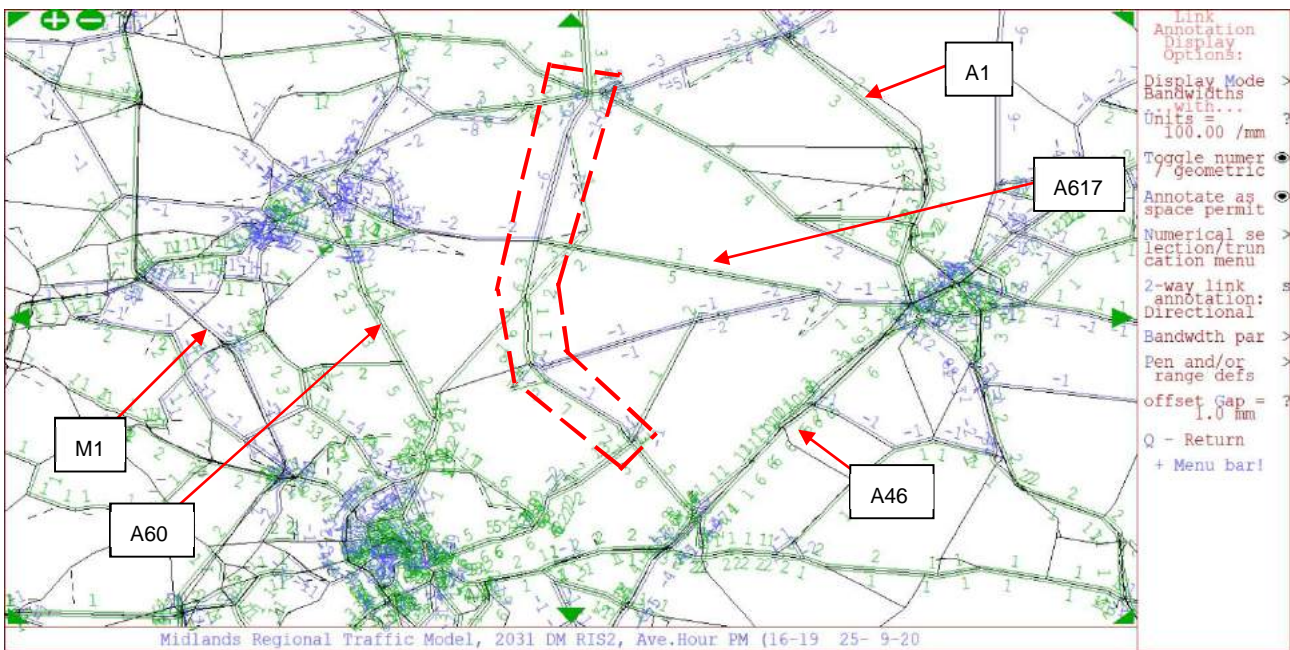

**Figure 42 - 2031 IP Pre vs Post VDM demand flow difference plot**

**Figure 43 - 2031 PM Pre vs Post VDM demand flow difference plot**

The plots demonstrate that there are no significant changes in the outcome of the modelling as a result of the VDM process. Changes in demand across the board are small and insignificant.

This is reflected further in the tables below showing a comparison of demand flow on six key links along the scheme corridor, against both the do-minimum and pre-VDM scenario (Test 3 fixed assignment).

**Table 12 - AM Northbound VDM demand flow comparison**

Location		DM	Test 3	VDM	Diff to DM	Diff to Test 3
A6097 Gunthorpe Bridge	NB	1,106	1,160	1,163	5%	0%
A6097 North of Lowdham	NB	654	719	721	10%	0%
A6097 Oxton Bypass	NB	481	561	570	18%	2%
A614 White Post	NB	905	971	977	8%	1%
A614 Bilsthorpe	NB	920	926	923	0%	0%
A614 North of Ollerton	NB	585	609	611	4%	0%

**Table 13 - AM Southbound VDM demand flow comparison**

Location		DM	Test 3	VDM	Diff to DM	Diff to Test 3
A6097 Gunthorpe Bridge	SB	788	794	797	1%	0%
A6097 North of Lowdham	SB	643	640	640	0%	0%
A6097 Oxton Bypass	SB	534	531	532	0%	0%
A614 White Post	SB	1,041	1,049	1,047	1%	0%
A614 Bilsthorpe	SB	845	832	829	-2%	0%
A614 North of Ollerton	SB	682	677	677	-1%	0%

**Table 14 - PM Northbound VDM demand flow comparison**

Location		DM	Test 3	VDM	Diff to DM	Diff to Test 3
A6097 Gunthorpe Bridge	NB	1,138	1,164	1,172	3%	1%
A6097 North of Lowdham	NB	703	741	748	6%	1%
A6097 Oxton Bypass	NB	474	527	534	13%	1%
A614 White Post	NB	835	868	871	4%	0%
A614 Bilsthorpe	NB	914	917	911	0%	-1%
A614 North of Ollerton	NB	532	546	550	3%	1%

**Table 15 - PM Southbound VDM demand flow comparison**

Location		DM	Test 3	VDM	Diff to DM	Diff to Test 3
A6097 Gunthorpe Bridge	SB	754	776	781	4%	1%
A6097 North of Lowdham	SB	580	553	552	-5%	0%
A6097 Oxton Bypass	SB	454	448	448	-1%	0%
A614 White Post	SB	952	937	937	-2%	0%
A614 Bilsthorpe	SB	870	863	851	-2%	-1%
A614 North of Ollerton	SB	656	630	633	-3%	1%

On these key links in the scheme corridor, the difference between the pre and post VDM assignments exceeds no more than 2%. When compared to the do-minimum, the scale of change is similar to the change in the fixed demand assignment tests.

To further demonstrate the small change that the VDM process has made, the table below shows the matrix totals for each time period, before and after the process.

**Table 16 - Pre and Post VDM 2031 matrix totals**

Time Period	Pre-VDM Matrix Total	Post-VDM Matrix Total	Change
AM	6,697,648	6,697,664	+16
IP	5,796,734	5,796,719	-15
PM	7,376,223	7,376,222	-1

As can be seen, there is minimal change in the trip matrices totals as a result of the VDM.

## Summary

- The MCHM explicitly contains three of the junctions that are part of the scheme.
- Fixed demand assignment testing of the improvements produces very little re-routing response along the scheme corridor, principally due to the lack of other routing options to cross the River Trent.
- Increases in demand along the scheme corridor arising from the fixed demand assignments are small, but most prominent on the A6097 Oxtun Bypass.
- VDM elicits minimal change in either the matrices or the assignment, when the pre and post VDM matrices are assigned and the model outputs compared.

## Conclusions

- A review of the MCHM model local validation was undertaken to determine the suitability of the MCHM for use in the strategic model testing. It was concluded that the MCHM was appropriate for use in the proposed sensitivity tests but does not contain sufficient detail along the A614/A6097 corridor to support scheme appraisal directly.
- The results of the reassignment and Variable Demand Model tests show no material impact along the A614/A6097 corridor. Notwithstanding, the largest impacts are in the AM peak. The largest differences along the scheme corridor are in the range of 60-70 equivalent passenger car units (PCUs) per hour. This equates to an average increase of approximately 1 pcu per minute.
- In the inter-peak period, flow changes are less than 20 pcus/hr in all cases. Given the inter-peak periods represent the majority of the day and represent the largest proportion of the annualisation process, used to derive AADT and AAWT flows.
- Given this the reassignment and VDM impacts are not considered material in either the economic or environmental appraisal. As such, the original fixed-trip assessment used is considered appropriate and additional work to rework the traffic forecasts and appraisal is not considered proportionate.

# Appendix A – A614 Journey Time Validation

Time-distance graphs for the A614-A6097 journey time route, taken from the spreadsheets which underly the model validation report, are shown below.

**Figure 1 - Time-distance graph: A614 northbound AM**

**Figure 2 - Time-distance graph: A614 northbound IP**

**Figure 3 - Time-distance graph: A614 northbound PM**

**Figure 4 - Time-distance graph: A614 Southbound AM**

**Figure 5 - Time-distance graph: A614 southbound IP**

**Figure 6 - Time-distance graph: A614 southbound PM**

The table below expands Table 2 from the A614 Strategic Assessment technical note dated September 2020, in order to include the modelled to observed journey time route differences for the A1 and M1 journey time routes, alongside those for the A614-A6097.

**Figure 7 - Model Validation Report journey time route study**

Time and Direction	Modelled/Observed Journey Time Differences		
	A614/A6097	A1	M1
AM Northbound	10.3%	-1.3%	3.8%
AM Southbound	0.7%	-0.7%	3.3%
IP Northbound	3.4%	-3.1%	2.9%
IP Southbound	-1.7%	-1.7%	3.6%
PM Northbound	1.7%	-0.4%	3.2%
PM Southbound	1.1%	0.1%	4.7%

It should be noted that while the A1 and M1 routes are both parallel routes, for the purposes of the validation, both are significantly longer than the A614 route (the A614-A6097 route is approximately 40km, while the A1 route is approximately 125km and the M1 route is approximately 110km). The M1 and A1 are also both part of the Strategic Road Network (SRN), and better validation is expected in the Regional Models for these routes than for non-SRN routes.

## Appendix B – A614 Select Link Sector to Sector Analysis

To provide further detail to the information provided in the A614 Strategic Assessment technical note dated September 2020, select link analysis for two links was performed on the base year models in the AM and PM peaks. The matrices from this analysis have been extracted and analysed in a sector-to-sector format in order to further explore if there are re-routing possibilities.

### Gunthorpe Bridge Select Link

Select Link analysis was performed on the link representing the A6097 Gunthorpe Bridge which crosses the River Trent approximately half way between the A6011 and A60 crossings in the West Bridgford area of Nottingham and the A617 and A1 to the west and north of Newark. The size of the select link matrices are detailed below.

Direction	Time Period	Matrix Size (PCUs per hour)
Northbound	AM Peak	1,050
Southbound		561
Northbound	PM Peak	964
Southbound		605

### Sector Definition

A ten sector system was defined for this select link, as outlined below.

Sector	Sector Name	Definition
1	Greater Nottingham North	Zones in the Nottingham urban area north of the River Trent, including Long Eaton, Stapleford, Beeston, Wollaton, Arnold, Carlton and Netherfield.
2	Greater Nottingham South	Zones in the Nottingham urban area south of the River Trent, including West Bridgford, Compton Acres, and Clifton.
3	Mansfield	Zones falling within Mansfield, and Sutton-in-Ashfield.
4	Beyond Mansfield	Zones accessed to the west and north west of Mansfield, including Derbyshire, Sheffield, and the north west of England.

5	Beyond Nottingham	Zones accessed to the south and west of Nottingham and Nottinghamshire, including Leicester and Birmingham.
6	North	Zones accessed to the north of Nottinghamshire, including Yorkshire.
7	Newark	Zones representing Newark.
8	Lincoln	Zones representing Lincoln and the surrounding areas in the north of Lincolnshire, including Gainsborough and Market Rasen.
9	Grantham	Zones representing Grantham and the immediate surrounding area.
10	Beyond Grantham	Zones representing Lincolnshire (less those in the Lincoln and Grantham segments), and remaining areas to the south and east of Grantham.
11	Nottinghamshire North	Zones in Nottinghamshire to the north of the River Trent (less Mansfield which is defined in another sector).
12	Nottinghamshire South	Zones in Nottinghamshire south of the River Trent (less Newark which is defined in another sector).

## Matrices

Matrices are shown below, showing the proportion of the total matrix in each cell.

**Table 1 – Gunthorpe Bridge northbound AM select link sector matrix**

Nottinghamshire North	0%	0%	0%	0%	21%	0%	3%	1%	5%	9%	0%	13%	54%
Nottinghamshire South	0%	0%	0%	0%	0%	0%	0%	0%	0%	0%	0%	0%	0%
Total	0%	0%	0%	0%	30%	0%	6%	1%	13%	24%	0%	26%	100%

Northbound, it is clear that the sector matrix indicates the majority of trips are originating from sectors south of the River Trent, and travelling to either the Greater Nottingham North

or Nottinghamshire North sectors (both of which are north of the Trent). This indicates the lack of route choice these trips have given the limited availability of crossings of the River Trent. These trips are originating from the Nottinghamshire South, Beyond Grantham, and Newark sectors among others.

For the southbound select link, a similar pattern is seen in reverse, with 78% of the trips in the matrix originating from either the Nottinghamshire North or Greater Nottingham sectors. All of these trips travel to sectors south of the River Trent.

There are minimal movements between larger sectors to the north and south using this route.

**Table 3 - Gunthorpe Bridge northbound PM select link sector matrix**

Total	0%	0%	0%	0%	32%	0%	12%	1%	9%	11%	0%	35%	100%

The PM sector matrices present a very similar pattern to the AM matrices.

## A614 Select Link

Select Link analysis was performed on the link representing the A614 to the immediate south west of the Warren Hill junction. The size of the select link matrices are detailed below.

Direction	Time Period	Matrix Size (PCUs per hour)
Northbound	AM Peak	488
Southbound		738
Northbound	PM Peak	509
Southbound		574

## Sector Definition

A seven-sector system was defined for this select link, as outlined below:

Sector	Sector Name	Definition
1	Worksop	Zones representing Worksop and its surrounds, including Carlton in Lindrick.
2	Retford	Zones representing Retford and its surrounds.
3	Greater Nottingham North	Zones in the Nottingham urban area north of the River Trent, including Long Eaton, Stapleford, Beeston, Wollaton, Arnold, Carlton and Netherfield.
4	Greater Nottingham South	Zones in the Nottingham urban area south of the River Trent, including West Bridgford, Compton Acres, and Clifton.
5	Lincolnshire	Zones representing Lincolnshire.
6	South	Zones representing the southern half of Derbyshire, and all other areas to the South.
7	North	Zones representing the northern half of Derbyshire, plus all other zones to the North.
8	Nottinghamshire North	Zones in Nottinghamshire to the north of the River Trent (less Worksop and Retford, which are defined in other sectors).
9	Nottinghamshire South	Zones in Nottinghamshire south of the River Trent.

**Matrices**

Matrices are shown below, showing the proportion of the total matrix in each cell.

**Table 5 - A614 northbound AM select link sectored matrix**

	Worksop	Retford	Greater Nottingham North	Greater Nottingham South	Lincolnshire	South	North	Nottinghamshire North	Nottinghamshire South	Total
Worksop	0%	0%	0%	0%	0%	0%	0%	0%	0%	0%
Retford	0%	0%	0%	0%	0%	0%	0%	0%	0%	0%
Greater Nottingham North	10%	20%	0%	0%	1%	0%	26%	31%	0%	88%
Greater Nottingham South	1%	1%	0%	0%	0%	0%	4%	4%	0%	9%
Lincolnshire	0%	0%	0%	0%	0%	0%	0%	0%	0%	0%
South	0%	0%	0%	0%	0%	0%	0%	0%	0%	0%
North	0%	0%	0%	0%	0%	0%	0%	0%	0%	0%
Nottinghamshire North	0%	0%	0%	0%	0%	0%	0%	1%	0%	1%
Nottinghamshire South	0%	0%	0%	0%	0%	0%	0%	1%	0%	1%
Total	12%	21%	0%	0%	1%	0%	30%	37%	0%	100%

**Table 6 - A614 southbound AM select link sectored matrix**

	Worksop	Retford	Greater Nottingham North	Greater Nottingham South	Lincolnshire	South	North	Nottinghamshire North	Nottinghamshire South	Total
Worksop	0%	0%	14%	1%	0%	0%	0%	0%	0%	15%
Retford	0%	0%	15%	1%	0%	0%	0%	2%	0%	18%
Greater Nottingham North	0%	0%	0%	0%	0%	0%	0%	0%	0%	0%
Greater Nottingham South	0%	0%	0%	0%	0%	0%	0%	0%	0%	0%
Lincolnshire	0%	0%	4%	0%	0%	0%	0%	1%	0%	5%
South	0%	0%	0%	0%	0%	0%	0%	0%	0%	0%
North	0%	0%	19%	2%	0%	0%	0%	0%	0%	21%
Nottinghamshire North	0%	0%	34%	2%	0%	1%	0%	3%	1%	41%
Nottinghamshire South	0%	0%	1%	0%	0%	0%	0%	0%	0%	2%
Total	0%	0%	87%	5%	0%	2%	0%	6%	1%	100%

Northbound, the majority of trips originate from the Greater Nottingham North sector and travel to sectors further north. A small proportion originate from the Greater Nottingham South sector, and travel through Nottingham to use the A614 to travel north. Southbound, a similar situation is observed in reverse, with 87% of the trips in the matrix having the Greater Nottingham North sector as their destination.

**Table 7 - A614 northbound PM select link sector matrix**

	Worksop	Retford	Greater Nottingham North	Greater Nottingham South	Lincolnshire	South	North	Nottinghamshire North	Nottinghamshire South	Total
Worksop	0%	0%	0%	0%	0%	0%	0%	0%	0%	0%

Total	0%	0%	79%	7%	0%	6%	0%	7%	1%	100%

Largely similar patterns are observed in the PM peak as the AM peak. Northbound, 83% of the trips originate from the Greater Nottingham North sector, though a small proportion (3%) travel to Lincolnshire rather than to sectors further north. Southbound, 79% of the trips in the matrix have the Greater Nottingham North sector as their destination.

## Appendix C – Traffic Growth

The tables below show the growth in demand from the MCHM strategic transport model, on the link representing the A614 immediately south of the roundabout where it meets the A617, between the 2015 base year and the do-minimum forecast year models.

**Figure 1 - A614 northbound growth in demand (MCHM)**

Peak Hour Time Period	2015 Base Demand (PCUs)	2026 Demand (PCUs)	Growth from Base	2031 Demand (PCUs)	Growth from Base	2041 Demand (PCUs)	Growth from Base
AM	838	880	5.0%	905	8.0%	965	15.2%
IP	605	633	4.6%	668	10.4%	740	22.3%
PM	775	805	3.9%	835	7.7%	894	15.4%

**Figure 2 - A614 southbound growth in demand (MCHM)**

Peak Hour Time Period	2015 Base Demand (PCUs)	2026 Demand (PCUs)	Growth from Base	2031 Demand (PCUs)	Growth from Base	2041 Demand (PCUs)	Growth from Base
AM	964	995	3.2%	1041	8.0%	1100	14.1%
IP	637	658	3.3%	704	10.5%	784	23.1%
PM	794	875	10.2%	952	19.9%	1059	33.4%

The growth in demand from the A614 MRN scheme forecasts are presented in Figure 3 and Figure 4 below for the same link, south of the A617/A614 roundabout.

**Figure 3 - A614 northbound growth in demand (A614/A6097 MRN)**

Peak Hour Time Period	2018 Base Demand (PCUs)	2024 Demand (PCUs)	Growth from Base	2037 Demand (PCUs)	Growth from Base
AM	996	1106	11.1%	1112	12.70%
IP	583	666	14.2%	676	15.9%
PM	898	1036	15.4%	1050	16.8%

**Figure 4 - A614 southbound growth in demand (A614/A6097 MRN)**

Peak Hour Time Period	2018 Base Demand (PCUs)	2024 Demand (PCUs)	Growth from Base	2037 Demand (PCUs)	Growth from Base
AM	910	1083	19.0%	1102	21.1%
IP	604	693	14.7%	704	16.5%
PM	887	987	12.5%	1001	14.1%

It is noted that the forecast years available from the MCHM do not coincide with the A614/A6097 opening year and design years used in the scheme appraisal and the data presented above are therefore not directly comparable.

It should be noted that the A614/A6097 2018 Base Year flows are observed count data, whereas the MCHM flows are modelled flows derived and controlled with limited count data along the scheme corridor.

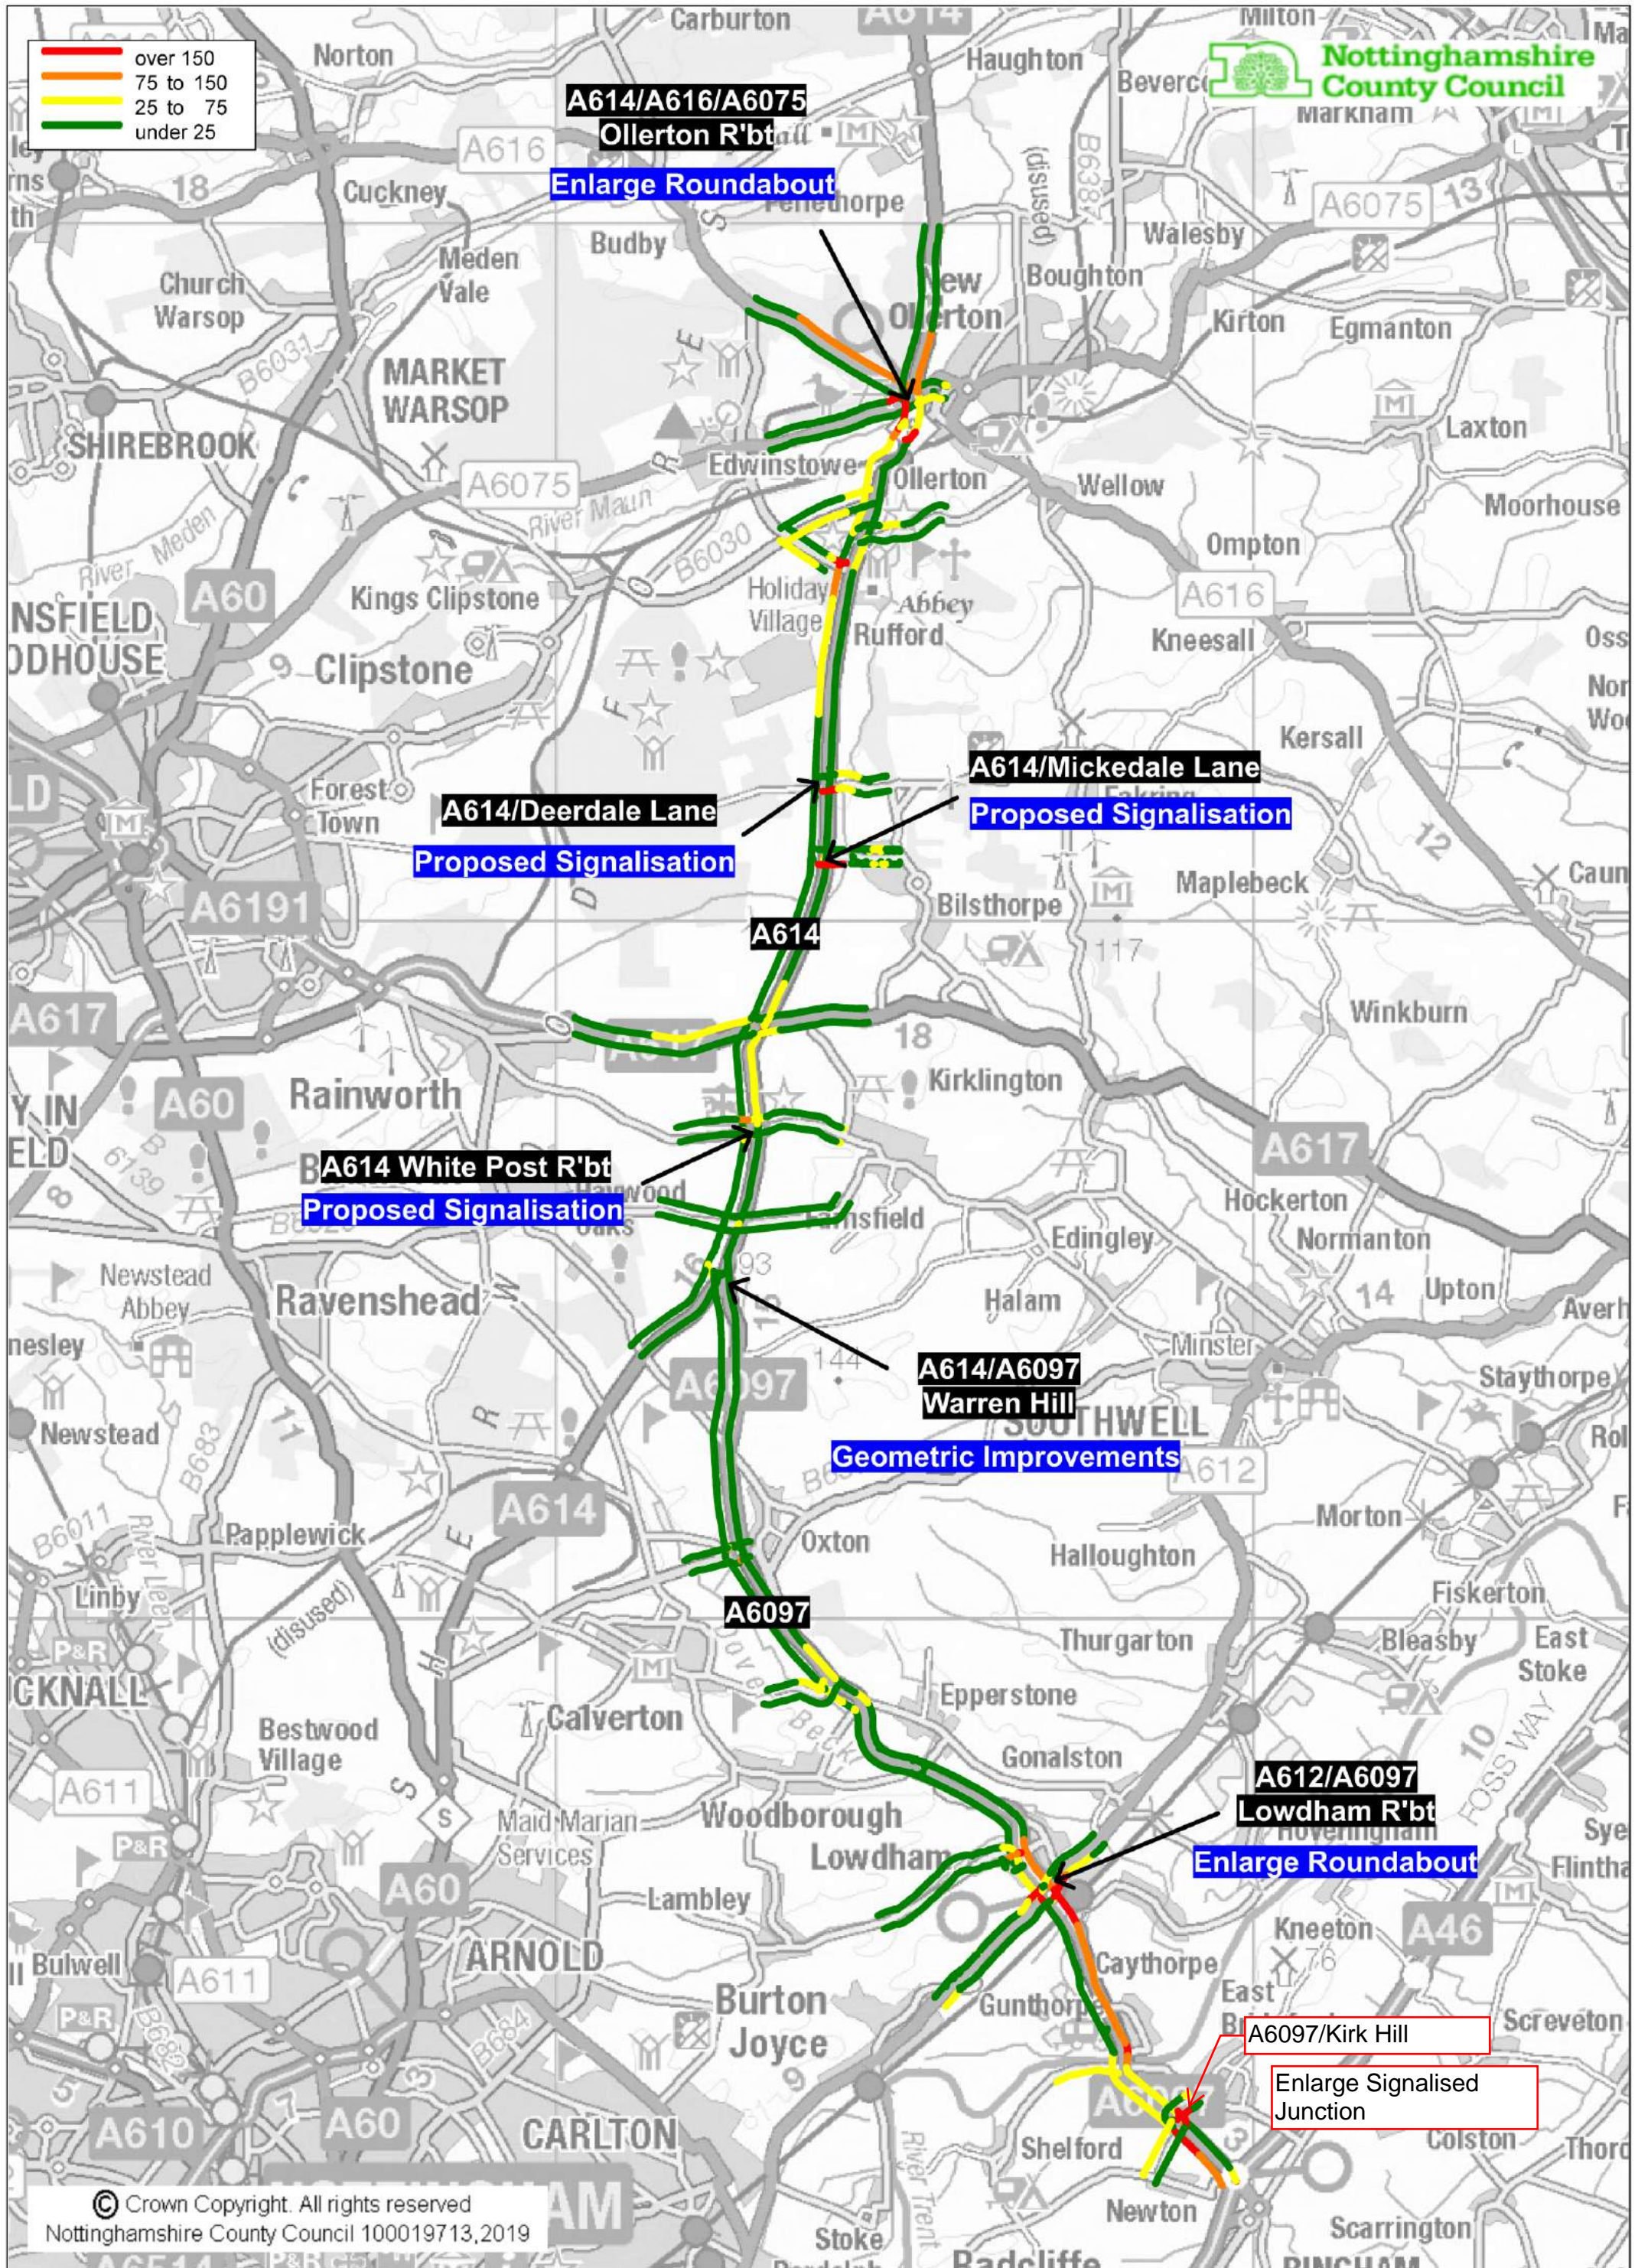

The A614/A6097 forecasts incorporates local planning data from which has not been reflected in the MCHM. This is shown in the higher growth in the scheme opening year, reflecting the planning authorities increased certainty of developments in the near term.

# Appendix C – Trafficmaster Average Vehicle Delay

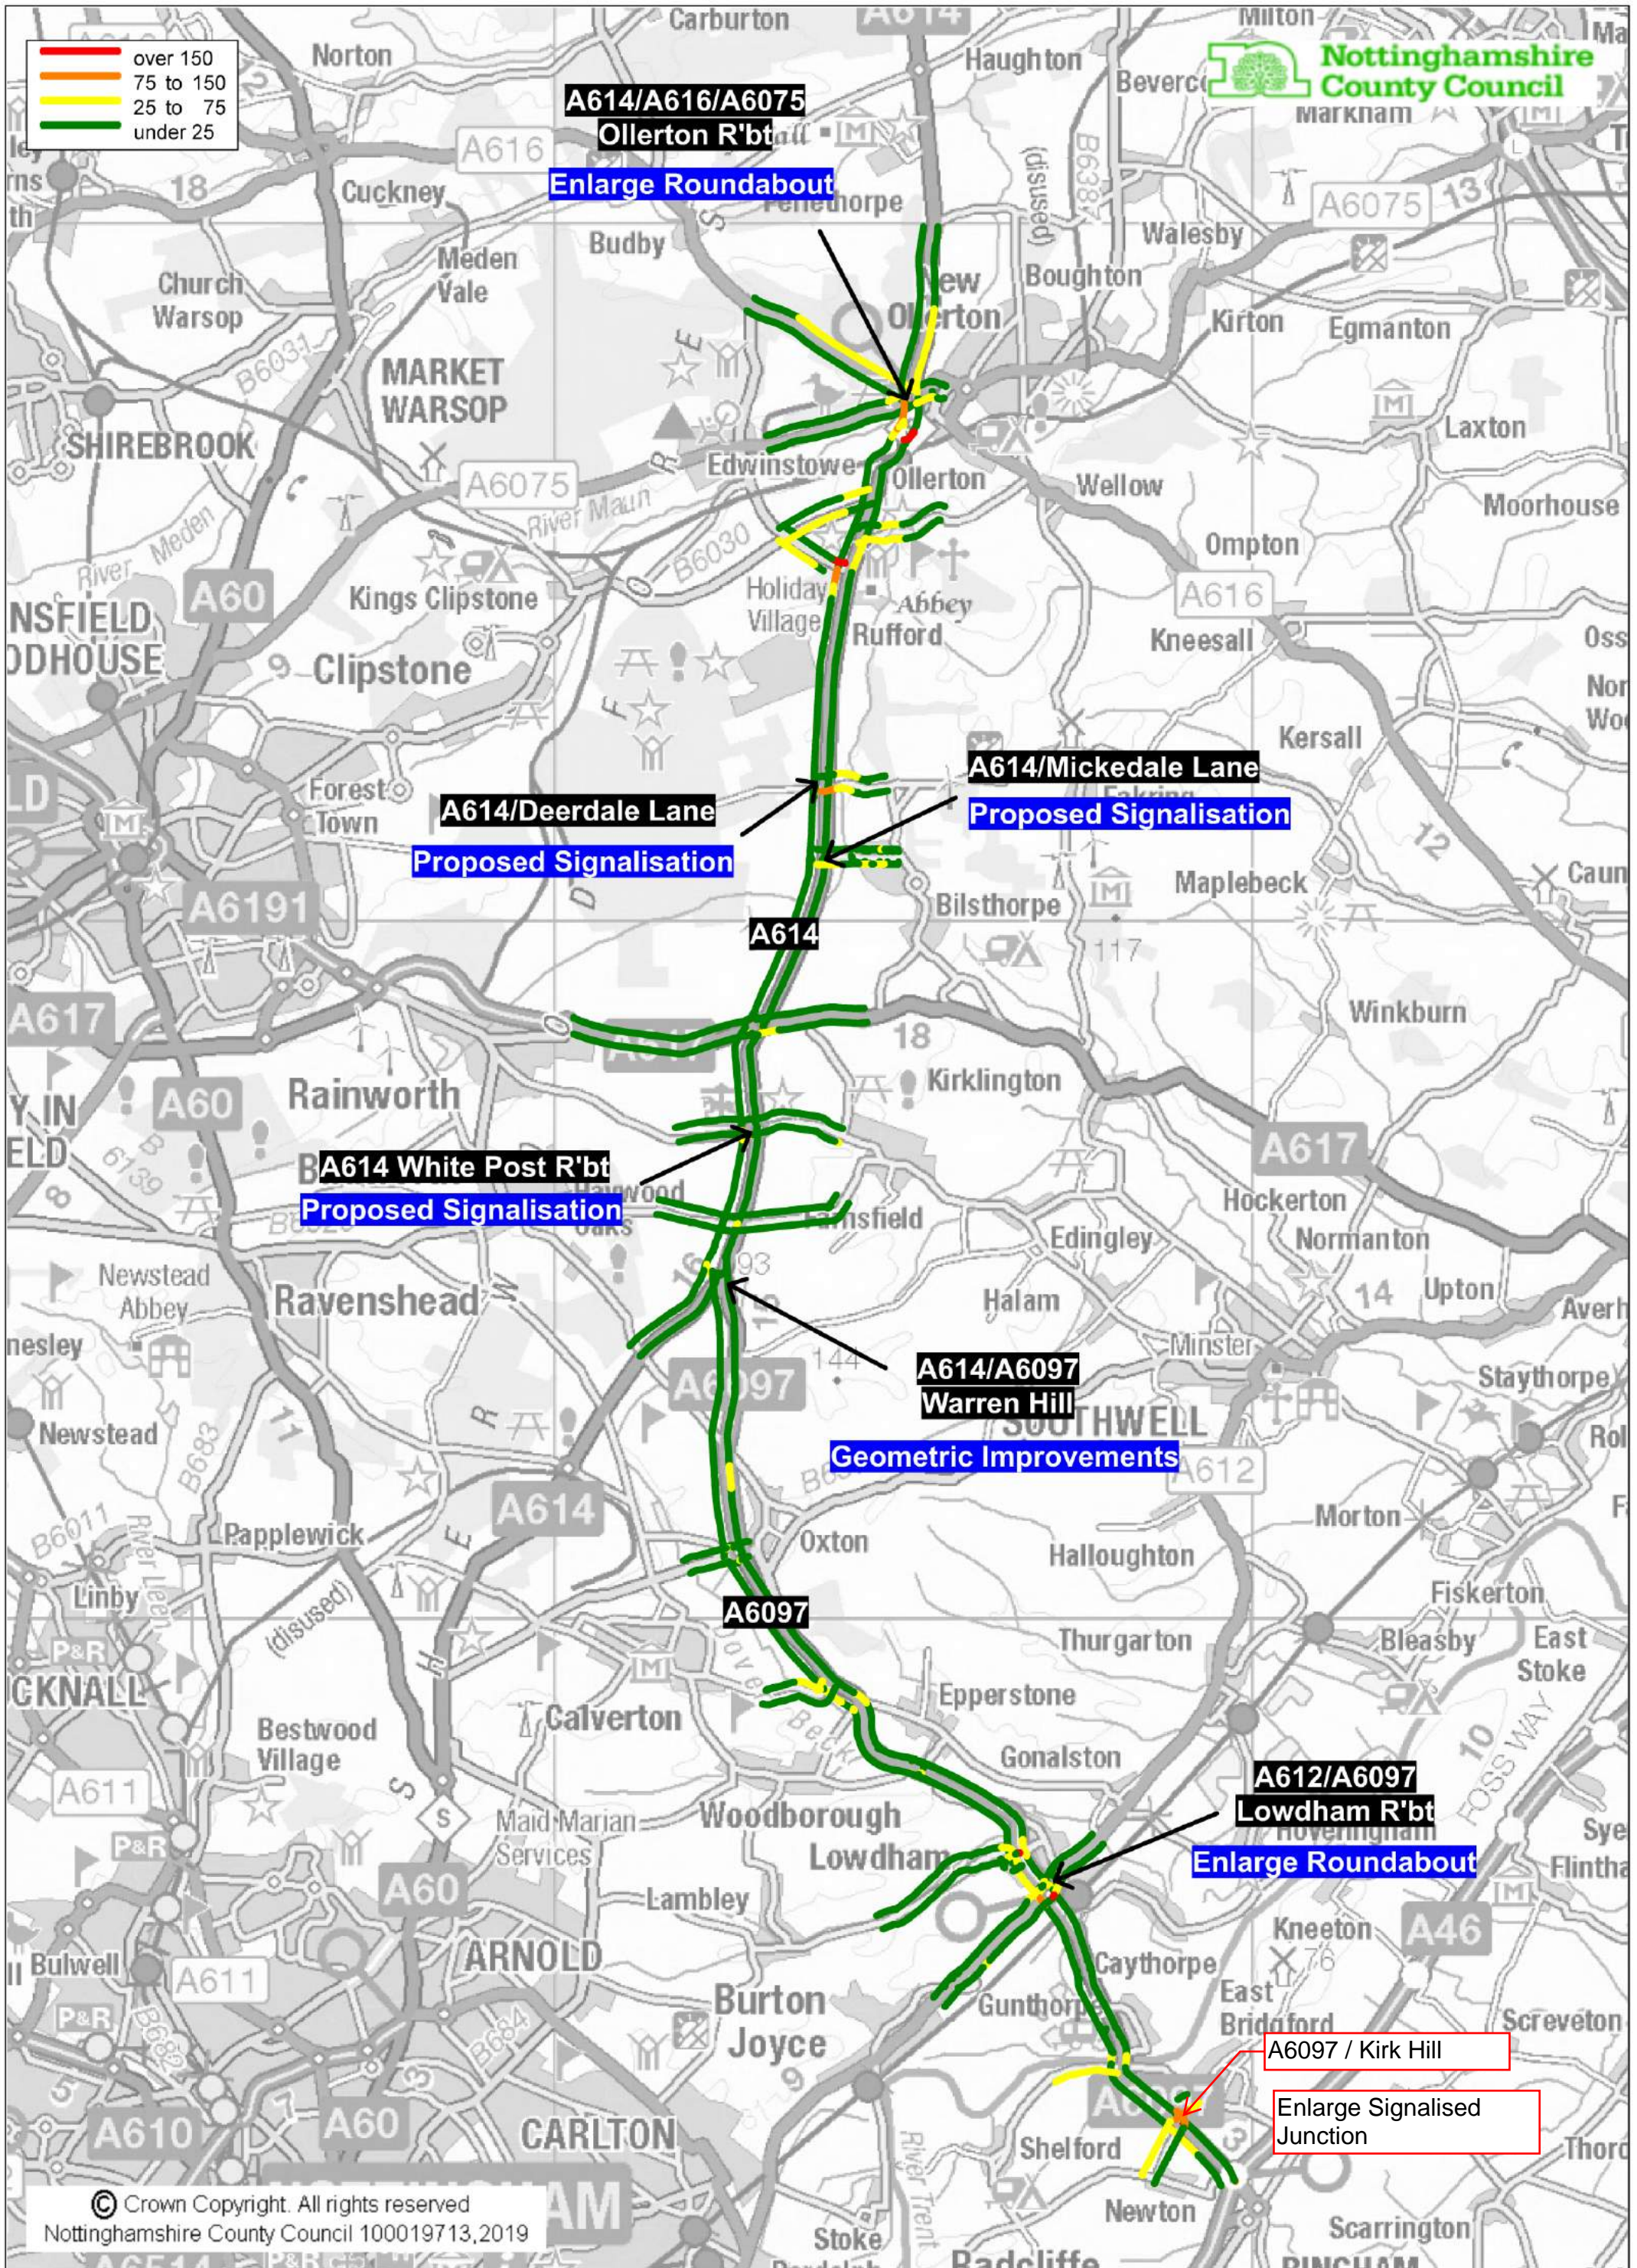

Vehicle delay per mile (seconds) for the A614/A6097 corridor during the morning peak (0800-0900) in 2018. Termtime only. Source: Trafficmaster GPS Data

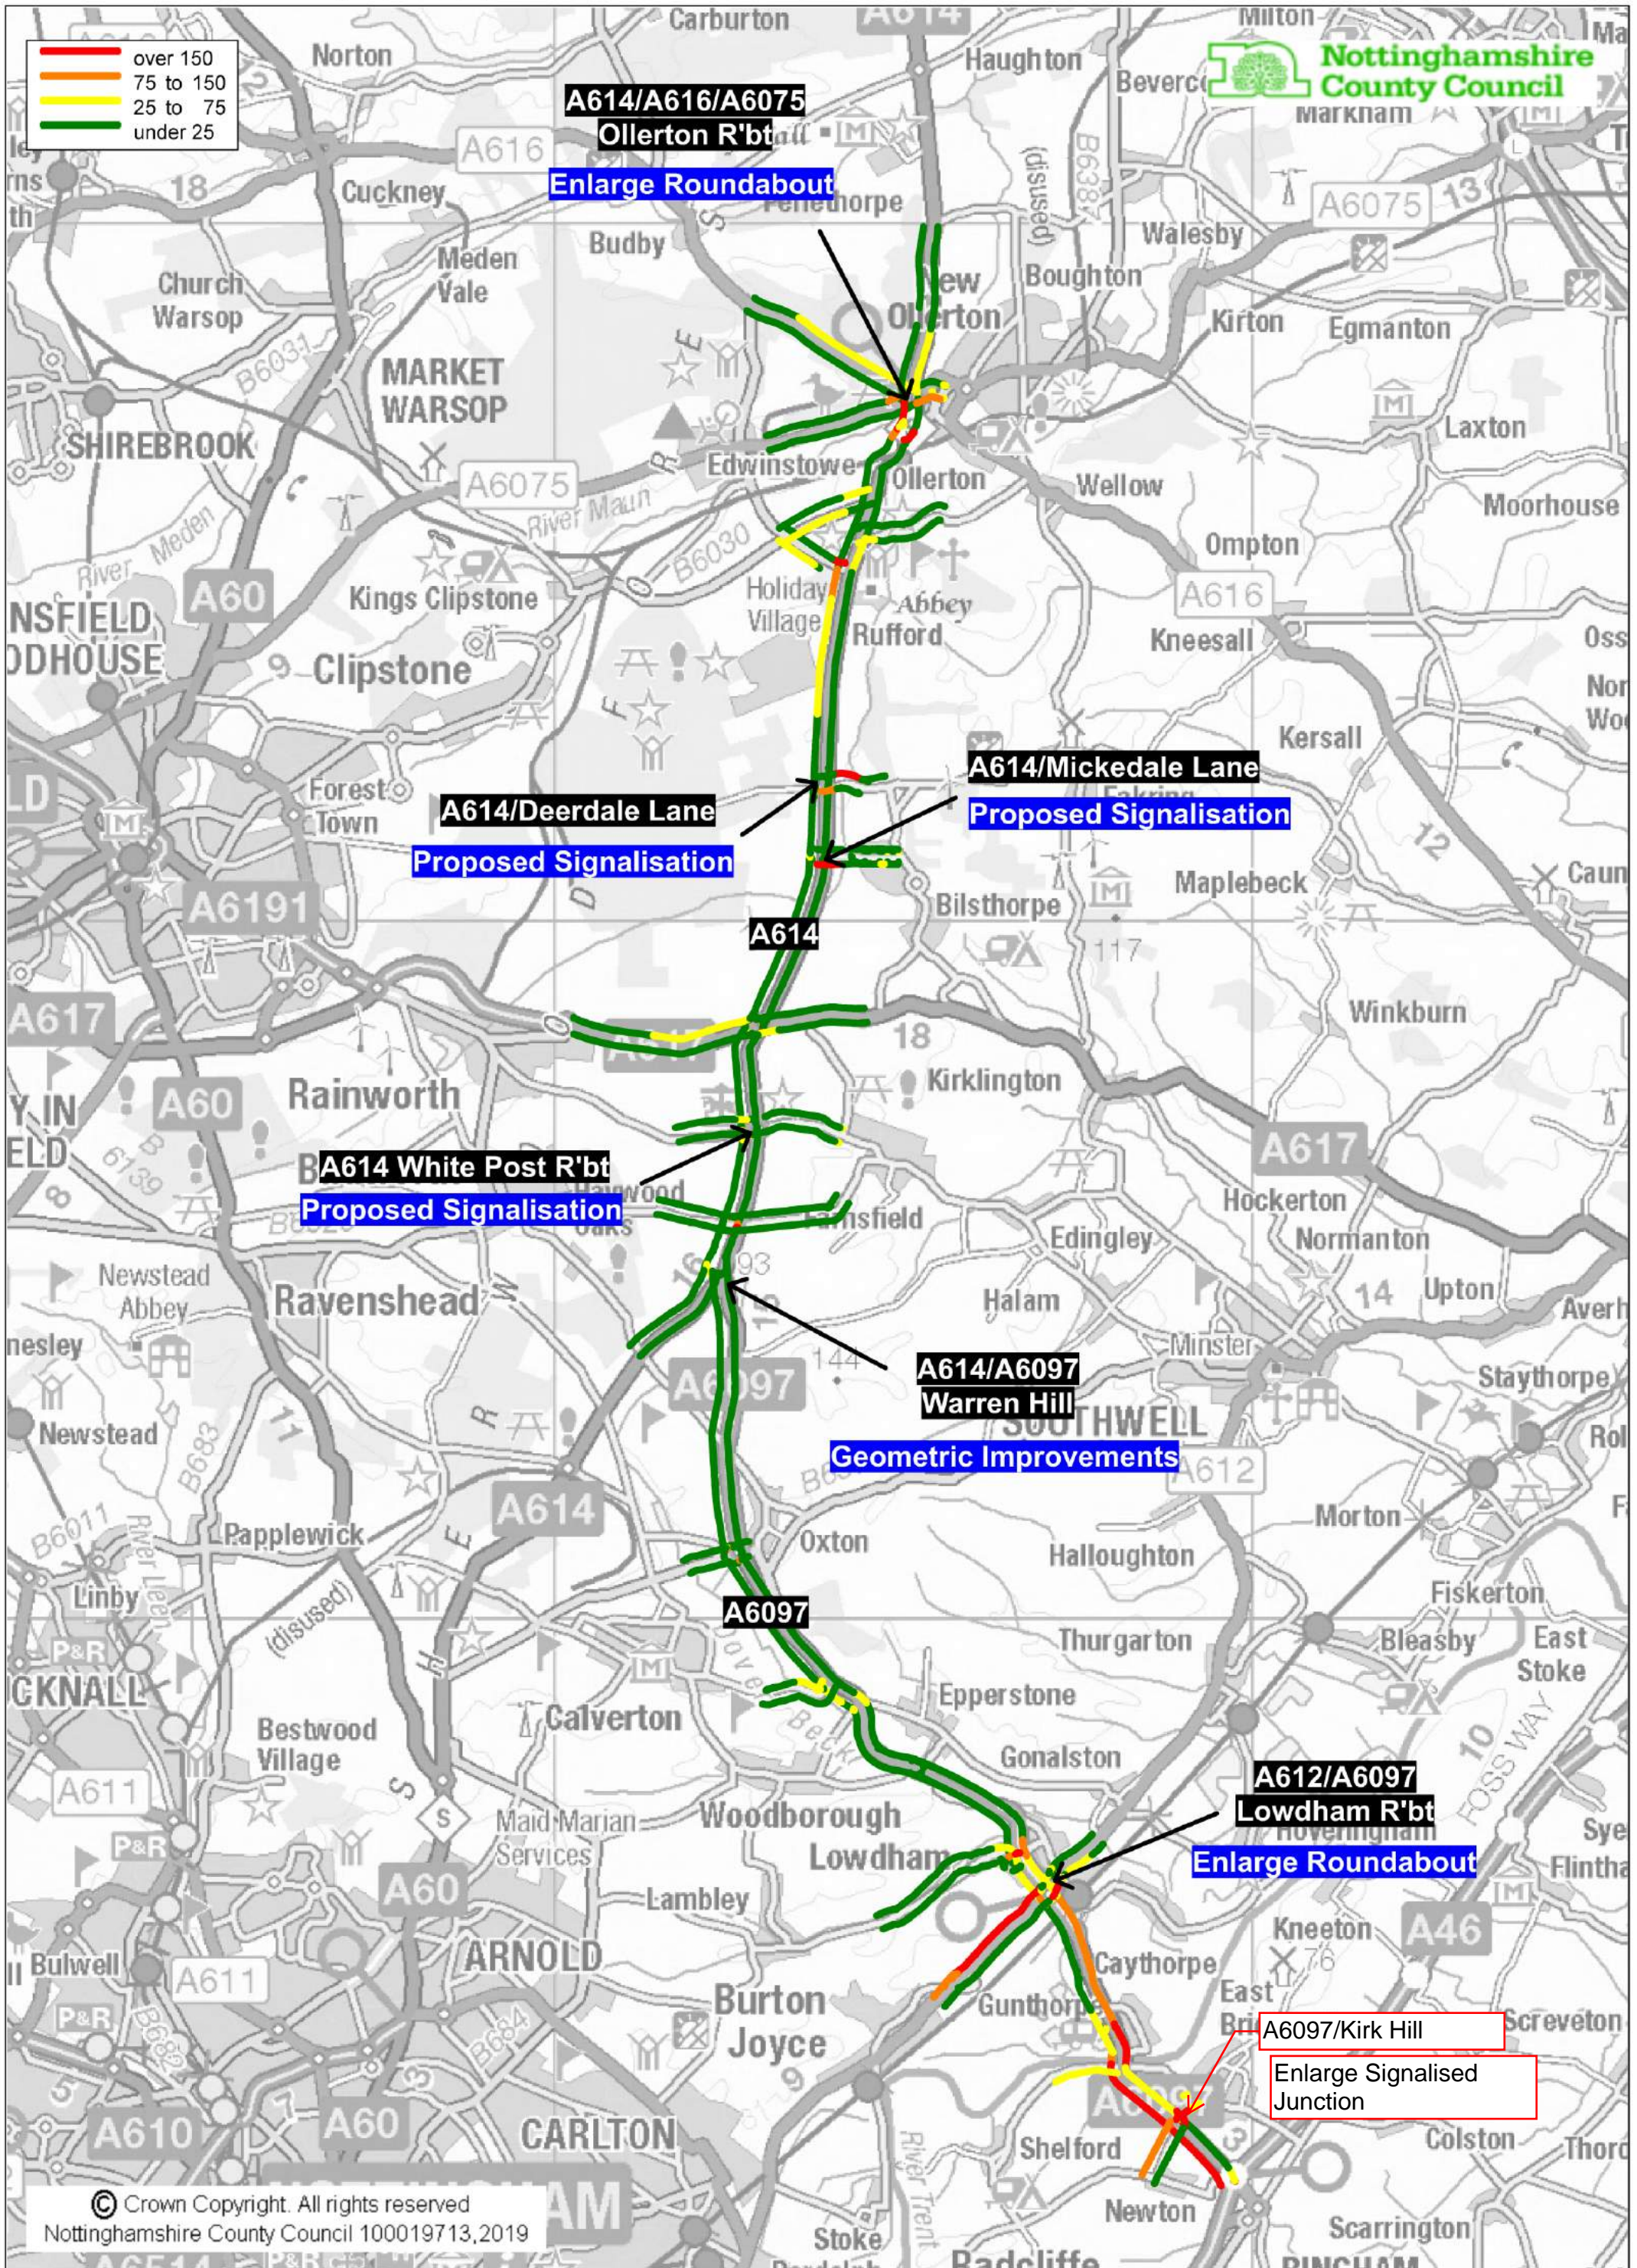

Vehicle delay per mile (seconds) for the A614/A6097 corridor during the inter peak (1000-1100) in 2018. Termtime only. Source: Trafficmaster GPS Data

Vehicle delay per mile (seconds) for the A614/A6097 corridor during the evening peak (1700-1800) in 2018. Termtime only. Source: Trafficmaster GPS Data

# Appendix G – Observed Public Service Vehicle Flows

- NOTES**
1. This drawing shows the updated revised layout of the enlarged 60m ICD roundabout improvements.
  2. The lane arrangements are configured to suit the current and future traffic forecast (2033) requirements.
  3. The proposed lane destination markings are provided to suit the current and future peak flow and are suggested to compliment the road signage to reduce the potential conflict associated with vehicles crossing over lanes.
  4. The layouts are subject to further road safety audits which will be commissioned following the detailed design stage.
  5. The revised layout has been produced using updated topographical survey information obtained June 2018.
  6. The precise extents of private land are subject to change which may be required as a result of the the detailed design process. The extents of embankments/ earth slopes are shown for indicative purposes and are based on the assumption that adjoining land does not significantly fluctuate in level. Where private land interfaces are restricted in respect of widths available retaining features may be required at these locations. Further verification for the embankment interface will be determined once updated private land topographical survey information and detailed design information is available.
  7. A preliminary analysis has been undertaken to verify vertical design requirements, this has determined that the proposals could meet this design criteria if the speed limits on the approaches were altered to 30mph. Further verification in to the affect of the vertical design on to adjoining land is to be determined during the detailed design process.
  8. Refer to feasibility report produced August 2018 by Via EM Ltd. for further information on the proposals and the departures from standards required.

# Appendix I – Dependent Development TN

Project:	<b>A614</b>	Job No:	<b>60625845</b>
Subject:	<b>TN02_Dependent Development Base Year Test</b>		
Prepared by:	<b>Sam Shearstone</b>	Date:	<b>24/11/20</b>
Checked by:	<b>Adam Hall</b>	Date:	<b>17/12/20</b>
Lead Verifier:	<b>David Elliott</b>	Date:	<b>18/12/20</b>
Approved by:	<b>Adam Hall</b>	Date:	<b>18/12/20</b>

# 1. Introduction

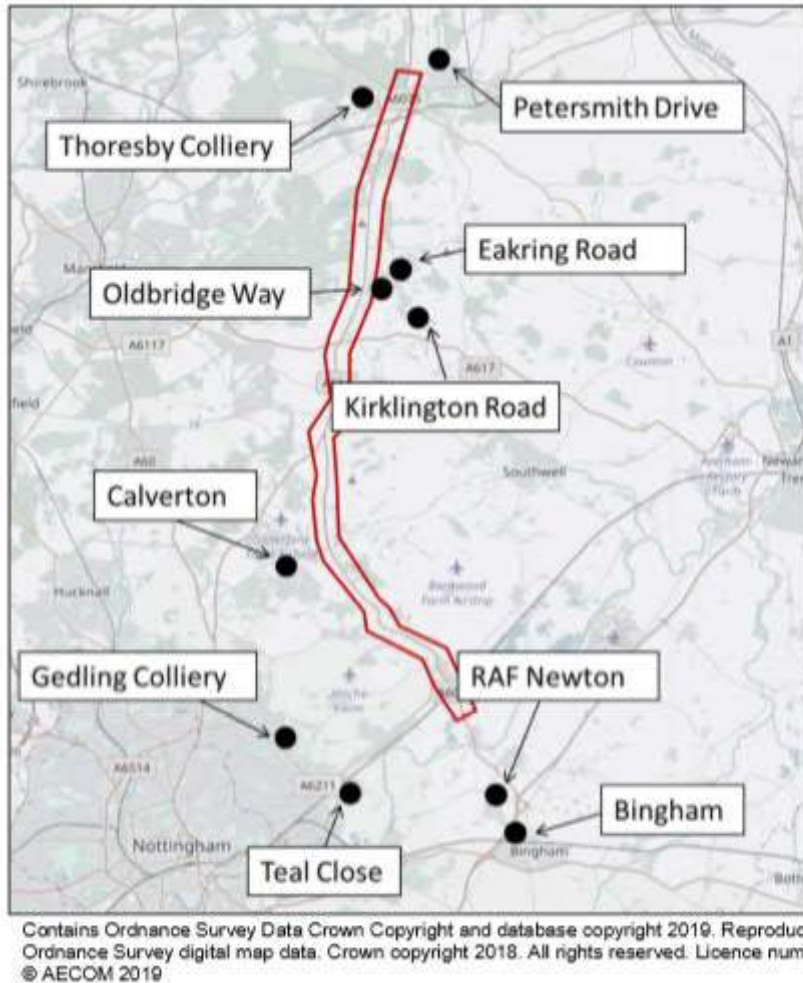

1.1 Nottinghamshire County Council (NCC) is promoting junction improvements at a series of locations on the A614 – A6097 corridor as a single scheme package. The location of these junctions are shown in Figure 1.

**Figure 1 - Junction Locations**

1.2 As detailed in the A614/A6097 Major Road Network Improvement Scheme-Traffic and Economic Assessment Report (TEAR), Table 2.4, numerous development sites were identified in vicinity of the scheme along with any planning conditions attached. The location of these sites is shown in Figure 2.

Figure 2 – Development Locations

- 1.3 This technical note provides details of the planning conditions relating to the junction improvements at Ollerton and Lowdham and provides evidences to conclude that the development at Thoresby Colliery and Teal Close is considered dependent development on the A614/A6097 MRN Improvement Scheme.
- 1.4 As noted in the TEAR dated December 2020, Table 2.4, the developments at Thoresby Colliery (Planning Application Number- 16/02173) and Teal Close (Planning Application Numbers- 2013/0546 and 2017/0999) are limited until improvements at Ollerton Roundabout and Lowdham Roundabout are made.
- 1.5 As outlined in TAG guidance unit A2.2 (May 2020), Section 3, Dependent development “*refers to new development that is dependent on the provision of a specific transport scheme and for which, with the new development but in the absence of the transport scheme, the existing transport network would not provide a reasonable level of service to existing and/or new users. This has the implication that the development would not be delivered in the absence of the specific transport scheme. It is also noted that the development may have planning permission conditional on a transport investment, but this is not a prerequisite for it to be considered dependent.*”

## 2. Dependent Development Dependency Test

- 2.1 TAG unit A2.2, May 2020 notes that the level of dependency of a site is dependent on the proportion of development that may be accommodated before breaching an acceptable level of service on the transport network.
- 2.2 TAG Unit A2.2, paragraph 3.1.6 states:
- 2.3 *“There is no precise definition of reasonable level of service, such that decisions about dependency are judgement based. However, if additional traffic can be accommodated by the network without significant increases in the costs of travel for existing users, then the network can be assumed to provide a reasonable level of service. “*
- 2.4 TAG Unit A2.10, paragraph A2.10 states:
- 2.5 *“... it is assumed that in the baseline scenario the network provides a reasonable level of service. Clearly if that is not the case then the new development is likely to be wholly dependent on some form of transport scheme. However, it must be demonstrated that the baseline scenario does not provide a reasonable level of service before this conclusion can be reached.”*
- 2.6 A ARCADY junction models, developed by VIA East Midlands, were used to assess the capacity of the Ollerton and Lowdham Roundabouts using 2018 Base Year observed traffic flows.
- 2.7 For existing junctions, Ratio to Flow Capacity (RFC) values above 0.85 are likely to produce queues which increase slowly. Above an RFC value of 1.0, a junction is more than likely to be at capacity (with resulting larger increases in queue length).

The outputs from the 2018 Base Year ARCADY junction models are shown in Table 1 to

2.8 Table 4.

**Table 1: Ollerton Base Year ARCADY Assessment Results-AM**

AM								
	Queue (PCU)	95% Queue (PCU)	Delay (s)	RFC	LOS	Junction Delay (s)	Junction LOS	Network Residual Capacity
BY								
Arm A616E	0.9	1.8	4.04	0.48	A	36.78	E	-8 % [Arm A614S]
Arm A614S	20.9	74.6	79.77	1.00	F			
Arm A6075	1.5	4.9	12.96	0.61	B			
Arm A616W	7.1	34.7	69.20	0.91	F			
Arm A614N	1.0	2.8	6.91	0.51	A			

**Table 2: Ollerton Base Year ARCADY Assessment Results-PM**

PM								
	Queue (PCU)	95% Queue (PCU)	Delay (s)	RFC	LOS	Junction Delay (s)	Junction LOS	Network Residual Capacity
BY								
Arm A616E	2.4	4.1	7.23	0.71	A	30.42	D	-9 % [Arm A614S]
Arm A614S	21.8	69.4	100.71	1.01	F			
Arm A6075	1.1	3.8	10.15	0.52	B			
Arm A616W	1.5	5.5	16.64	0.60	C			
Arm A614N	0.9	2.7	5.60	0.47	A			

**Table 3: Lowdham Base Year ARCADY Assessment Results-AM**

AM							
	Queue (PCU)	Delay (s)	RFC	LOS	Junction Delay (s)	Junction LOS	Network Residual Capacity
Existing Layout - BY							
1 - Southwell Road	3.2	27.09	0.77	D	14.65	B	2 % [1 - Southwell Road]
2 - A6097	4.9	14.75	0.84	B			
3 - Nottingham Road	3.0	15.23	0.76	C			
4 - Epperstone By-Pass	3.7	10.13	0.79	B			

**Table 4: Lowdham Base Year ARCADY Assessment Results-PM**

PM							
	Queue (PCU)	Delay (s)	RFC	LOS	Junction Delay (s)	Junction LOS	Network Residual Capacity
Existing Layout - BY							
1 - Southwell Road	1.3	10.38	0.58	B	72.01	F	-14 % [3 - Nottingham Road]
2 - A6097	6.8	17.37	0.88	C			
3 - Nottingham Road	73.5	266.32	1.18	F			
4 - Epperstone By-Pass	1.4	5.35	0.59	A			

- 2.9 In the 2018 Base Year, Ollerton roundabout is overcapacity, with at least one arm having a Ratio to Flow Capacity (RFC) value in excess 1.0) in both the AM and PM Peak periods, demonstrating that the existing junction is not currently providing a reasonable level of service.
- 2.10 At Lowdham, the existing roundabout is approaching capacity in the AM peak and is over capacity in the PM peak with large delays occurring, demonstrating that the existing junction is not providing a reasonable level of service
- 2.11 In both cases, the new trips associated with the developments will further reduce the level of service at the two junctions and result in significant increases in the costs of travel for existing users.
- 2.12 The developments at Thoresby Colliery and Teal Close can therefore be considered as dependant development and excluded from the Core traffic forecast scenario.
- 2.13 Noting that dependent development is not included in the Core forecasts used to assess the transport user benefits of the scheme, an alternative forecast scenario that includes the trips associated with the dependent development sites has been produced. This forecast has been used to ensure the proposed junction designs have sufficient capacity.

### 3. Transport External Costs

- 3.1 As outlined in TAG unit A2.2 (May 2020), Paragraph 3.3.9, “Transport external costs refer to the costs imposed by dependent transport users on all other users, such as increased levels of congestion or over-crowding. These costs arise as a result of those trips which are dependent on the transport scheme.”
- 3.2 The approach to assessing the Transport External Costs (TEC) is detailed in TAG Unit A2.2, section 3.3.9 onwards.
- 3.3 The assessment of TEC requires two scenarios:

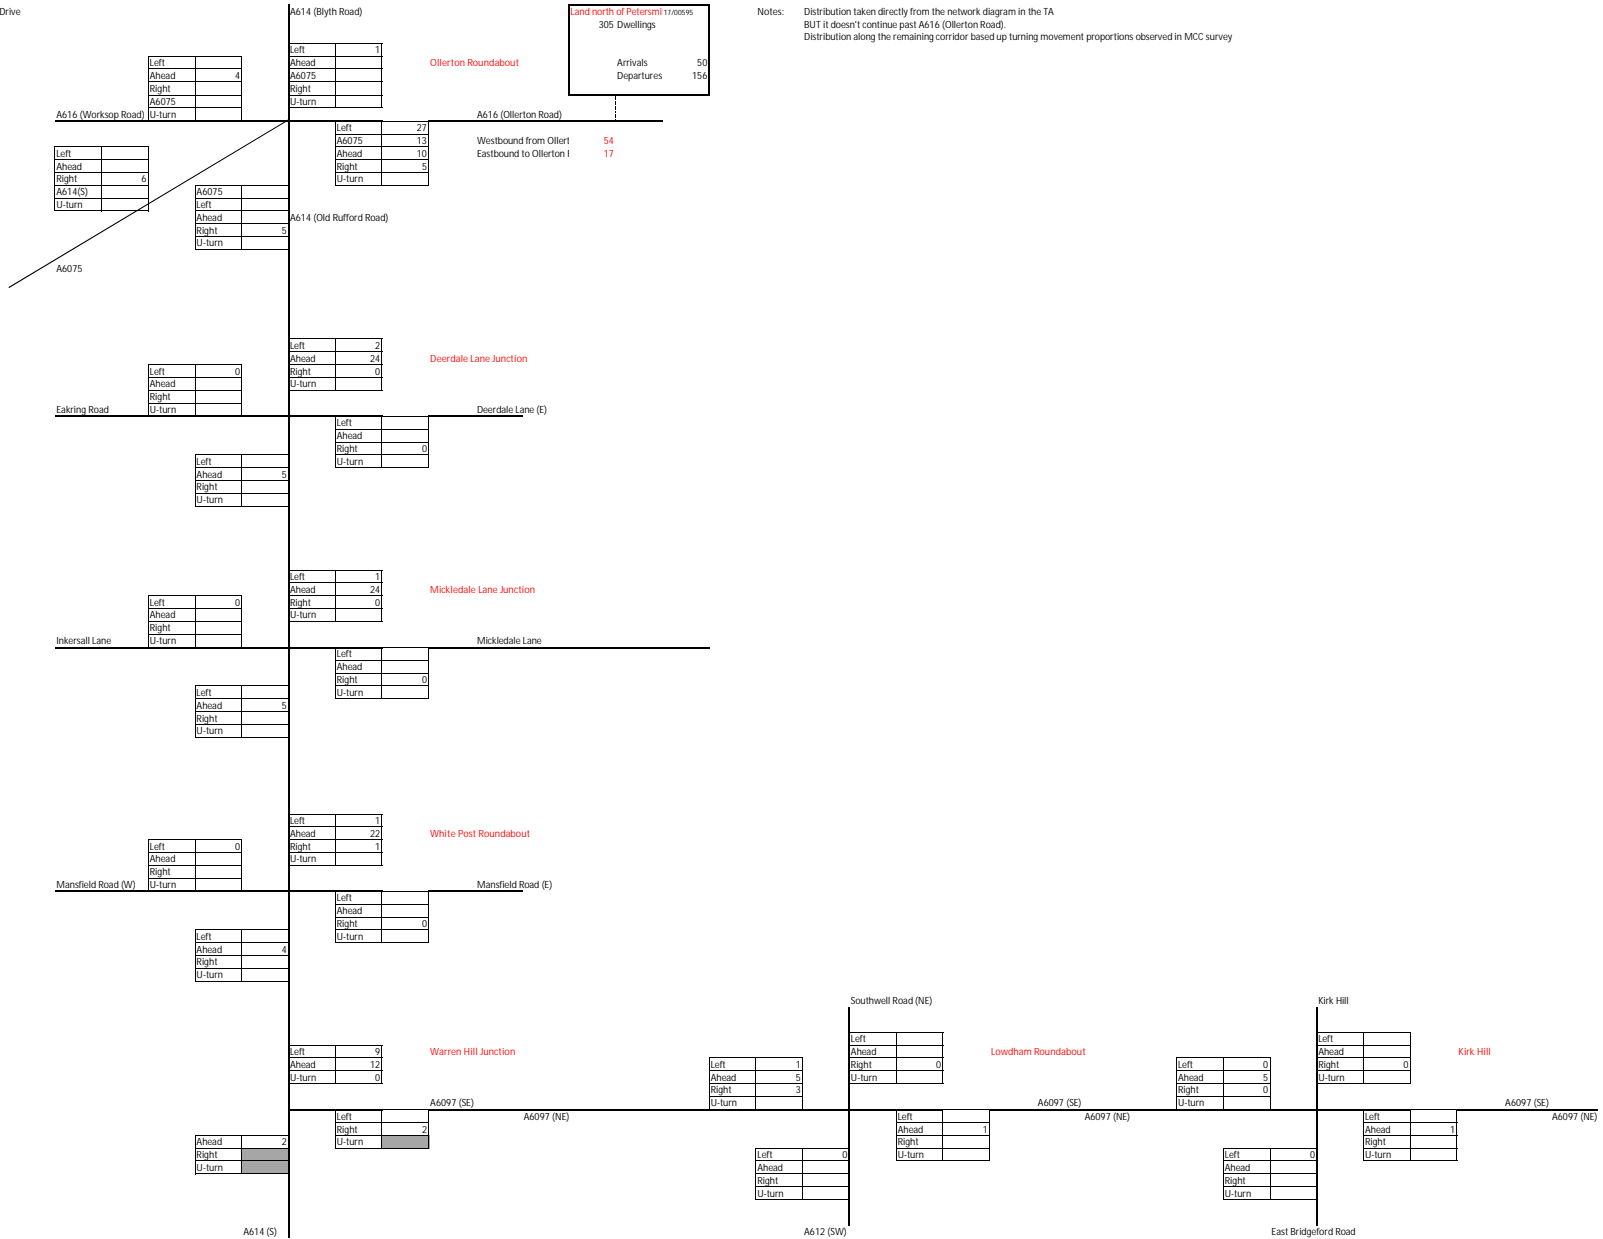

- Scenario S - without the new housing but with the transport scheme; and
  - Scenario R - with the new housing and with the transport scheme.
- 3.4 The TEC assessment, in accordance with TAG Unit A2.2, paragraph 3.3.10 consisted:
- Scenario S – Core Scenario Demand assigned on to the Do Something junction models
  - Scenario R –Dependent Development Demand assigned onto the Do Something junction models
- 3.5 The formulation of the forecast scenarios for the opening year (2023) and design year (2037) is documented in the TEAR (December 2020), Paragraph 2.76 onwards. This details the production of a Core forecast (excluding Dependent Development) and an alternative Dependent Development forecast.
- 3.6 The dependent elements of the Thoresby Colliery and Teal Close sites occur after the 2023 opening year but are fully included in the 2037 design year forecasts. Therefore, Scenario S and Scenario R in the 2023 element of the TEC analysis are the same.
- 3.7 A TEC analysis was undertaken for the Ollerton and Lowdham roundabouts using the Do Something (with scheme) ARCADY models. In 2023 both Scenario S and Scenario R used the Core trip demand. In 2037, Scenario S used the Core trip demand and Scenario R used the Dependent Development trip demand.
- 3.8 The methodology as detailed in TAG guidance unit A2.2 (May 2020) and the Department for Transport TUBA software V1.9.14 was used to undertake this analysis, with the TUBA economic parameters file (23/08/2020 v2, TAG Data Book v1.13.1 July 2020).
- 3.9 The TEC impacts are summarised for each junction in Table 5 below.

**Table 5: Transport External Costs (£000's)**

	Ollerton	Lowdham	Combined
<b>Consumer - Commuting user benefits</b>	-868	-754	-1622
<b>Consumer - Other user benefits</b>	-2,652	-961	-3,613
<b>Business User benefits</b>	-1,830	-641	-2,471
<b>Net Present Value of Benefits (PVB)</b>	<b>-5,350</b>	<b>-2,356</b>	<b>-7,706</b>

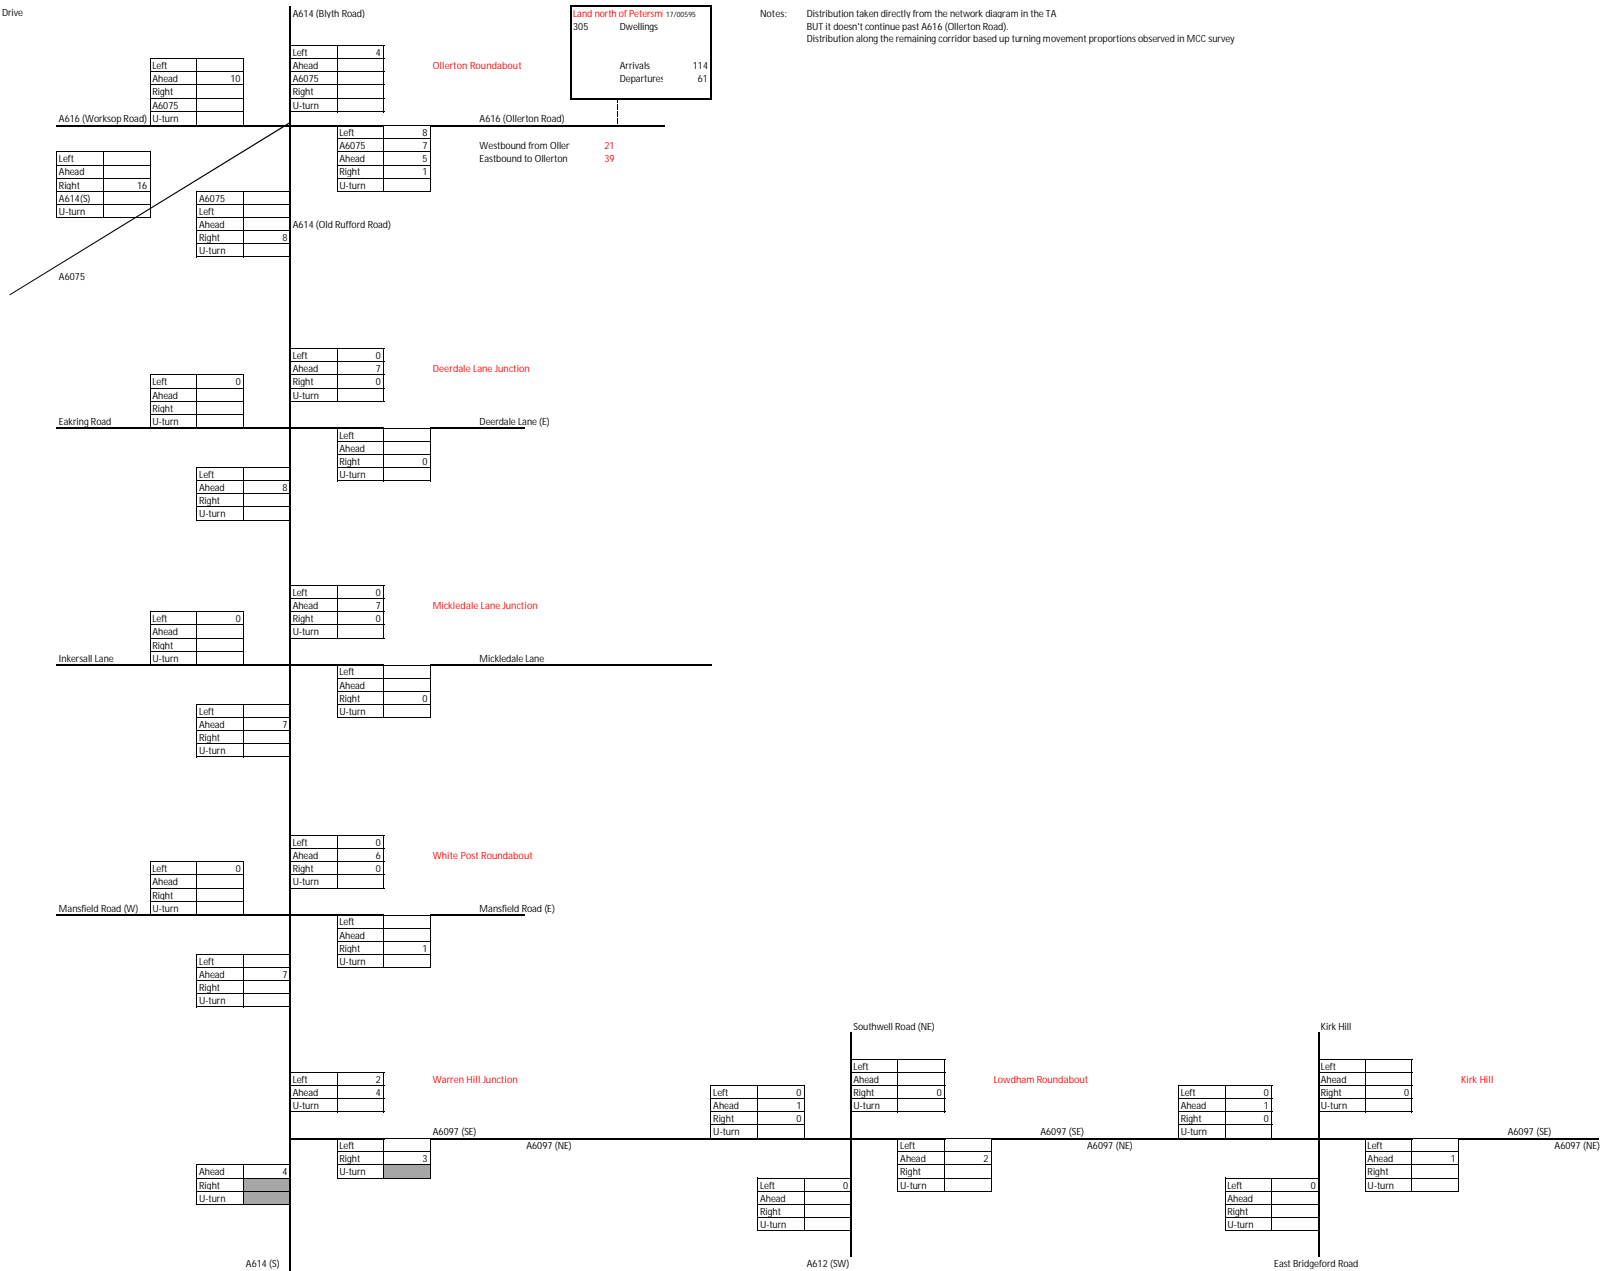

- 3.10 The TAG assessment of Transport External Costs results in an overall disbenefit with Present Value of Benefits of -£7.706m.
- 3.11 These TEC impacts represent an increase in costs to existing road users as a result of the addition of new trips from the dependent development sites.
- 3.12 The DfT's Value for Money Framework states that whilst benefits associated with Induced Investment should not be included in the initial benefit-cost results, it may be used to inform the scheme's value for money assessment. As such, monetised TEC impacts were excluded from the initial Analysis of Monetised Costs and Benefits but are presented to support the value for money case.

# Appendix J – Development Site Trip Distributions

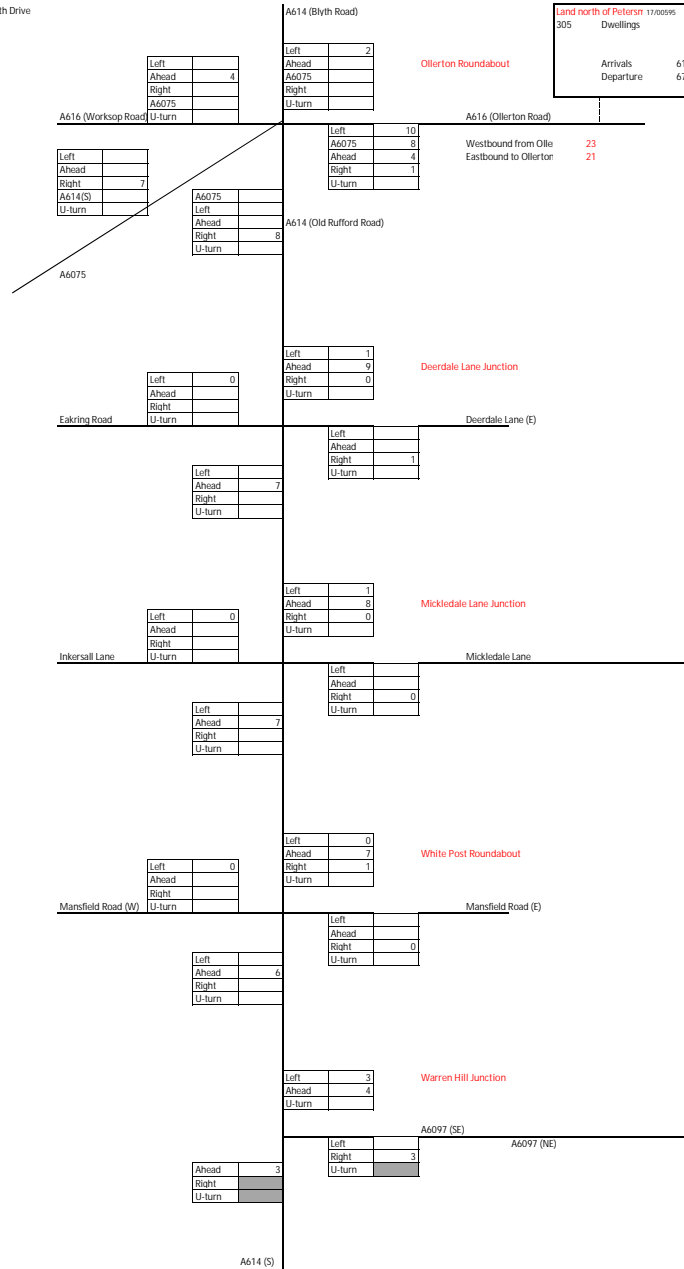

Notes: Distribution taken directly from the network diagram in the TA  
BUT it doesn't continue past A616 (Ollerton Road).

In addition, the following information was provided:

Newark sites

1. Land north of Petersmith Drive Ollerton. Gleasons the housebuilder are currently setting up the site and we expect construction to commence in 2019. Build out assumed at a rate of 50 houses per annum so should be completed in 5/6 yrs.
2. Thoresby Colliery- Detailed approval process ongoing. We construction to commence in 2020 at a build out rate of 50 -60 houses per annum. The current devt restriction of 150 dwgs should be triggered by 2023.
3. Land east of Eaking Rd Bilsthorpe. No recent activity on this appln / site. Still likely to be built out in next 3-5 years.
4. Kirklington Rd Bilsthorpe this application is not yet approved. Expect this site to be built out in next 3-5 years.
5. Oldbridge Way Bilsthorpe. A builder has been appointed (subject to contract) and construction expected late 2019 early 2020. Assume build out rate of 50 houses per annum

Rushcliffe sites

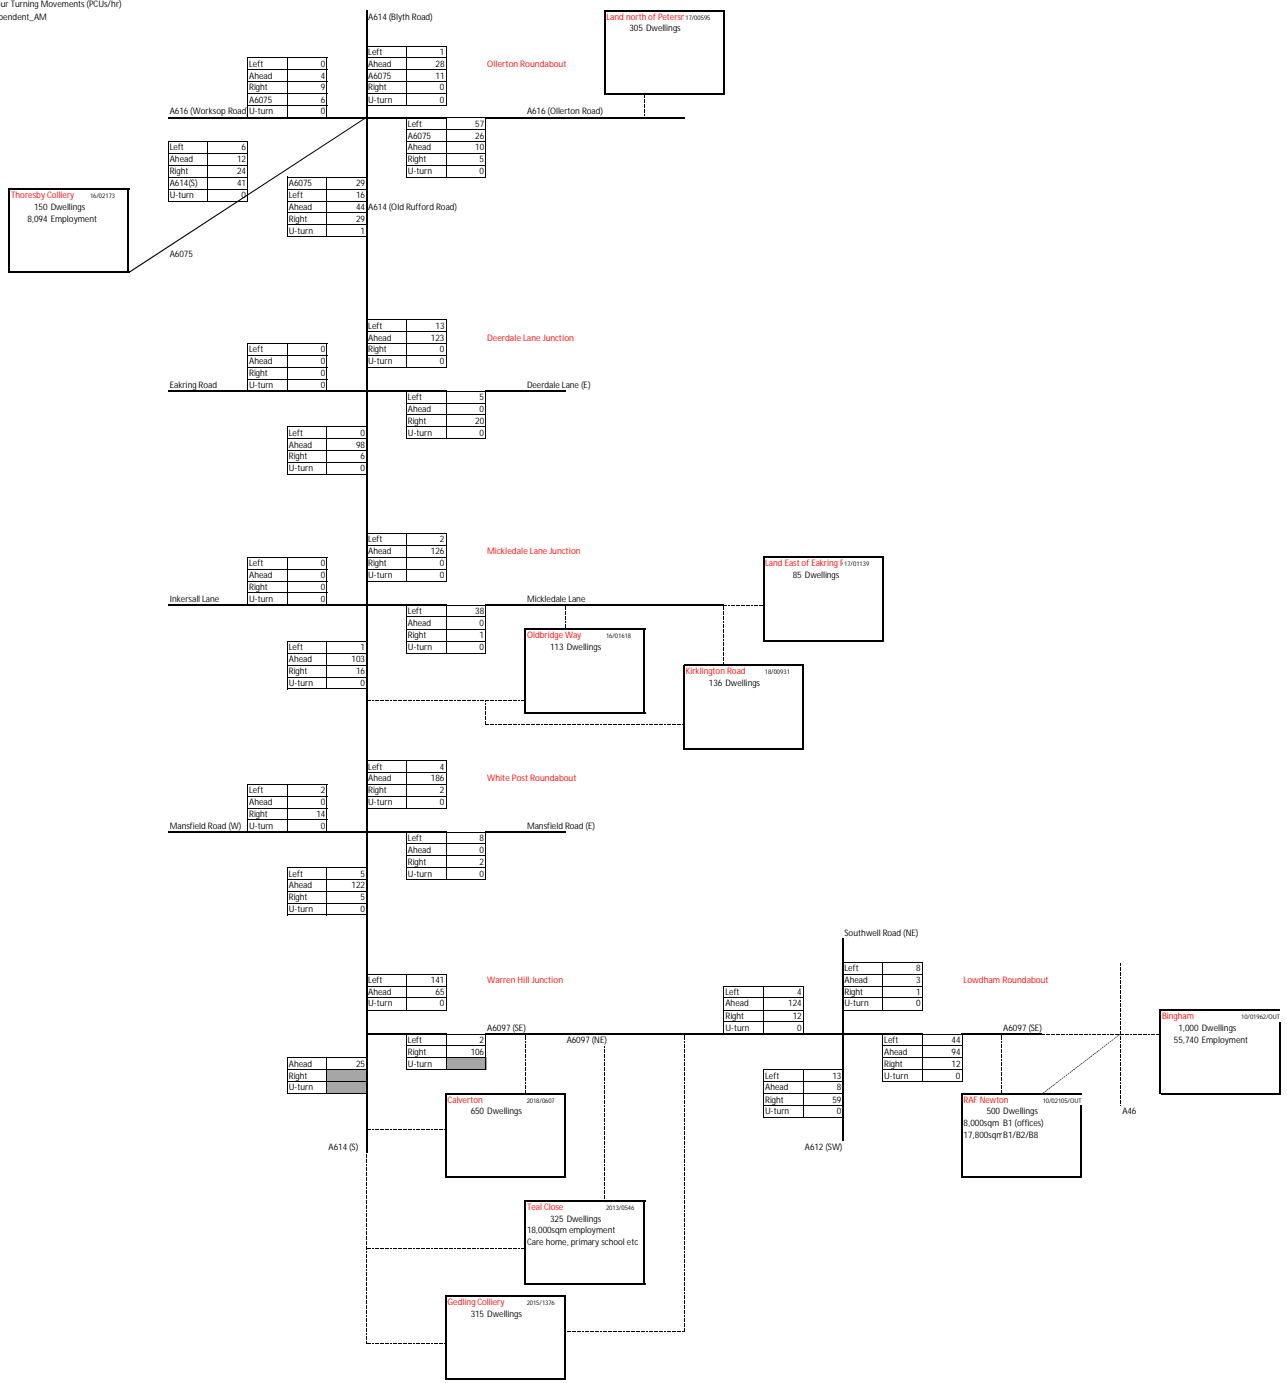

6. RAF Newton this site has had permission for some years. See attached projected delivery trajectory
7. Bingham this site has had permission for some years. See attached projected delivery trajectory.

Gedling sites

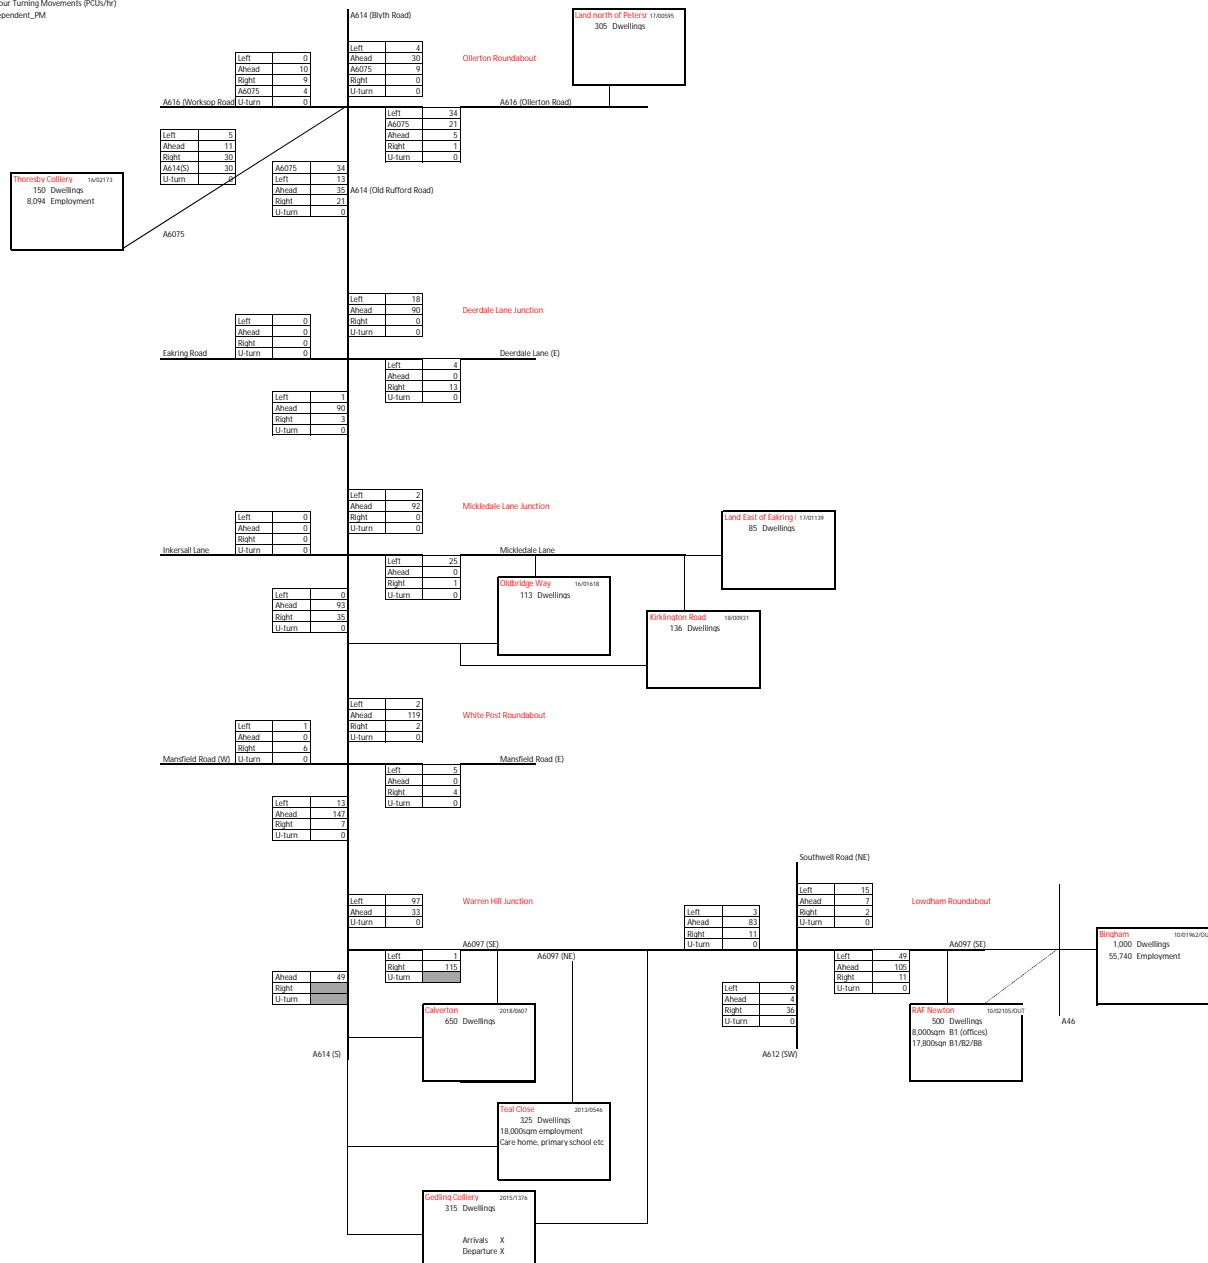

8. Calverton three current planning applications being considered 2018/1143, 2018/0817 and 2018/0607. We expect these sites to commence in 2019/20 and there to be 3 housebuilders. Assume 100 -150 houses per annum.
9. Teal Close site currently under construction no homes completed yet. Assume build out of 60 per annum from 2019 onwards.
10. Gedling Colliery- planning application 2015/1376 for 500 dwellings., of which the first 315 can be built in advance of the GAR. As at October 2018 there had been 53 completed houses on site. The site is being built out by Keepmoat Homes at a rate of 60 per year.

# Appendix Q – AADT Calculation

# Technical Note

---

Project:	<b>A614 Corridor MRN</b>	Job No:	<b>60595614</b>
Subject:	<b>AADT Factor calculation</b>		
Prepared by:	<b>Georgie Carpenter</b>	Date:	<b>15/12/2020</b>
Checked by:	<b>Daniel Godfrey</b>	Date:	<b>15/12/20</b>
Approved by:	<b>Adam Hall</b>	Date:	<b>15/12/20</b>

---

## 1.0 Introduction

This Technical Note (TN) has been prepared in response to a query raised by the DfT regarding the calculation of AADT values associated with the A614 corridor improvement scheme.

The following comment was raised:

*“The calculation of AADT is not clear; a worked example should be provided for the sake of clarity. Please provide a clearer explanation of how AADT flows were derived, being clear on the definition of what is an hourly flow, a peak hour flow and peak period flow and what those hours and periods are and subsequently how an AADT has been derived.*”

This TN explains the calculation of the AADT factor, supported by worked examples throughout.

## 2.0 Calculation of AADT factor

### Step 1: Long term count data

Long term count data on the A614 corridor was available from five sites:

- A614 Bilsthorpe (N) (Site ID: 000030306363);
- A614 Bilsthorpe (S) (Site ID: 000030306359);
- A6097 Warren Hill (S) (Site ID: 0000352206253);
- A6097 Lowdham (N) (Site ID: 000030806547); and
- A6097 Lowdham (S) (Site ID: 000030006745).

The locations of each site are shown in Figures 2.1 – 2.5.

Figure 2.1: A614 Bilsthorpe (N) (Site ID: 000030306363)

Figure 2.2: A614 Bilsthorpe (S) (Site ID: 000030306359)

**Figure 2.3:** A6097 Warren Hill (S) (Site ID: 0000352206253)

**Figure 2.4:** A6097 Lowdham (N) (Site ID: 000030806547)

Step 2: Combine count site data

The raw data from each count site is then summarized (by hour, by day) to yield a total for all count sites along the corridor, whereby:

Total = A614 Bilsthorpe (N) + A614 Bilsthorpe (S) + A6097 Warren Hill (S) + A6097 Lowdham (N) + A6097 Lowdham (S).

Figure 2.7 provides an example of the combined data for clarity (showing January 2018).

Figure 2.7: Combined count data (January 2018)

Table with columns for Northbound and Southbound directions, showing counts for each day of the month (Jan 1-31) across various time periods. The table is split into two sections: Northbound and Southbound.

Data was combined for the northbound and southbound directions separately.

Step 3: 5-day / 7-day corridor average

The 5-day and 7-day corridor average was then calculated as follows:

5-day average = Sum of all combined weekday traffic flows / number of weekdays

7-day average = Sum of all combined traffic flows / number of days

Table 2.1 and 2.2 presents the 5- and 7-day averages for the corridor for the northbound and southbound direction, respectively.

Table 2.1: 5- and 7-day averages (Northbound direction) – corridor total

Table with 3 columns: Time period (00:00:00 to 07:00:00), 5-day average, and 7-day average.

<b>24 hour total</b>	<b>45,231</b>	<b>41,528</b>

## Step 4: Calculate AADT Factors – Northbound & Southbound

Based upon Tables 2.1 and 2.2 above, the corridor total for each peak period can be found. These are shown in Table 2.3 and 2.4 for the northbound and southbound directions, respectively.

**Table 2.3:** Corridor totals by peak period (Northbound)

Time period	Description	Value
7- day 24 hour	Sum of all hours for the 7- day average	41,899
Weekday AM Peak	5- day average for 0800 – 0900*	3,699
Weekday PM Peak	5- day average for 1700 – 1800*	4,298
Weekday Off peak	Average value for the 5- day average between 1000 - 1600	255
Weekday InterPeak	Average value for the 5- day average between 2200 - 0600	2,875

\*Note: whilst the Network Peak hour for the corridor is recognised as 0730 – 0830 and 1630 - 1730, long term count data was not available for this time period and the closest peak hours have been used.

**Table 2.4:** Corridor totals by peak period (Southbound)

Time period	Description	Value
7- day 24 hour	Sum of all hours for the 7- day average	41,528
Weekday AM Peak	5- day average for 0800 – 0900*	3,793
Weekday PM Peak	5- day average for 1700 – 1800*	3,608
Weekday Off Peak	Average value for the 5- day average between 1000 - 1600	287
Weekday Inter Peak	Average value for the 5- day average between 2200 - 0600	2,712

\*Note: whilst the Network Peak hour for the corridor is recognised as 0730 – 0830 and 1630 - 1730, long term count data was not available for this time period and as such standard network peak hours have been used.

The AADT factor is then calculated as follows:

$$7\text{- day 24 hour} / (\text{Weekday AM Peak} + \text{Weekday PM Peak} + \text{Weekday Off Peak} + \text{Weekday Interpeak})$$

Whereby:

$$\text{Northbound factor} = (41,899 / (3,699 + 4,298 + 255 + 2,875)) = \mathbf{3.76}$$

$$\text{Southbound Factor} = (41,528 / (3,793 + 3,608 + 287 + 2,712)) = \mathbf{3.99}$$

## Step 5: Calculate corridor (two-way) AADT factor

The two-way AADT factor is then calculated as an average of the northbound and southbound AADT factors. Whereby:

$$\text{Corridor AADT Factor} = (\text{Northbound Factor} + \text{Southbound Factor}) / 2$$

$$\text{Corridor AADT Factor} = \mathbf{3.876}$$

## Step 6: Calculate AADT flows

The AADT factor calculated in Steps 1 – 5 is then multiplied by the sum of the Baseline AM, IP, PM and OP traffic flows to yield the AADT flows on the corridor, whereby:

$$AADT\ Flow = (AM\ Baseline + PM\ Baseline + IP\ Baseline + OP\ Baseline) * 3.876$$

An example of applying the AADT factor is shown in Tables 2.5 and 2.6 for the Ollerton roundabout.

**Table 2.5:** Ollerton Roundabout – Baseline (sum of AM, PM, IP and OP)

	A616(W)	A616(W)	A616(W)	A616(W)	A616(W)

A6075	65	835	2958	250	1

### 3.0 Conclusions and Summary

This TN provides a response to the comment raised by the DfT regarding the calculation of AADT values associated with the A614 corridor improvement scheme. The TN provides a step-by-step breakdown of the calculation methodology and is complemented by worked examples of the process throughout.

# Appendix S – Ollerton Roundabout Scheme Drawing and ARCADY Outputs

**NOTES**

1. This drawing shows the updated revised layout of the enlarged 60m ICD roundabout improvements.
2. The lane arrangements are configured to suit the current and future traffic forecast (2033) requirements.
3. The proposed lane destination markings are provided to suit the current and future peak flow and are suggested to compliment the road signage to reduce the potential conflict associated with vehicles crossing over lanes.
4. The layouts are subject to further road safety audits which will be commissioned following the detailed design stage.
5. The revised layout has been produced using updated topographical survey information obtained June 2018.
6. The precise extents of private land are subject to change which may be required as a result of the the detailed design process. The extents of embankments/ earth slopes are shown for indicative purposes and are based on the assumption that adjoining land does not significantly fluctuate in level. Where private land interfaces are restricted in respect of widths available retaining features may be required at these locations. Further verification for the embankment interface will be determined once updated private land topographical survey information and detailed design information is available.
7. A preliminary analysis has been undertaken to verify vertical design requirements, this has determined that the proposals could meet this design criteria if the speed limits on the approaches were altered to 30mph. Further verification in to the affect of the vertical design on to adjoining land is to be determined during the detailed design process.
8. Refer to feasibility report produced August 2018 by Via EM Ltd. for further information on the proposals and the departures from standards required.

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

## File summary

### File Description

Title	Ollerton Roundabout - existing 2036+psd+tc1
Location	A614/ A616/ A6075 Ollerton
Site number	
Date	12/02/2018
Version	
Status	(new file)
Identifier	
Client	NCC
Jobnumber	
Enumerator	NCCADMIN\br18
Description	

## Units

Distance units	Speed units	Traffic units input	Traffic units results	Flow units	Average delay units	Total delay units	Rate of delay units
----------------	-------------	---------------------	-----------------------	------------	---------------------	-------------------	---------------------

m	kph	PCU	PCU	perHour	s	-Min	perMin

The junction diagram reflects the last run of Junctions.

**Analysis Options**

Vehicle length (m)	Calculate Queue Percentiles	Calculate detailed queueing delay	Calculate residual capacity	Residual capacity criteria type	RFC Threshold	Average Delay threshold (s)	Queue threshold (PCU)
5.75	✓		✓	Delay	0.85	36.00	20.00

### Analysis Set Details

ID	Include in report	Network flow scaling factor (%)	Network capacity scaling factor (%)
A1	✓	100.000	100.000

## 2023, AM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	85.92	F

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	-16	Arm 2

## Arms

### Arms

Arm	Name	Description
1	A616 Ollerton Rd	
2	A614S Old Rufford Road	

3	A6075 Mansfield Road	
4	A616 Worksop Road	
5	A614N Blyth Road	

### Roundabout Geometry

Arm	V - Approach road half-width (m)	E - Entry width (m)	I' - Effective flare length (m)	R - Entry radius (m)	D - Inscribed circle diameter (m)	PHI - Conflict (entry) angle (deg)	Exit only
1	4.60	8.00	100.0	35.0	37.5	54.0	
2	4.00	4.20	5.0	13.0	37.5	31.0	
3	3.80	5.70	4.3	18.0	37.5	31.0	
4	3.50	4.10	4.5	7.5	37.5	51.0	
5	4.50	6.60	12.0	24.0	37.5	44.0	

### Slope / Intercept / Capacity

#### Roundabout Slope and Intercept used in model

Arm	Final slope	Final intercept (PCU/hr)
1	0.724	2178
2	0.543	1228
3	0.580	1378
4	0.460	1005
5	0.635	1700

*The slope and intercept shown above include any corrections and adjustments.*

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D1	2023	AM	ONE HOUR	07:45	09:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	817	100.000
2		ONE HOUR	✓	947	100.000
3		ONE HOUR	✓	475	100.000
4		ONE HOUR	✓	375	100.000
5		ONE HOUR	✓	524	100.000

## Origin-Destination Data

### Demand (PCU/hr)

		To				
		1	2	3	4	5

## 2023, PM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	73.19	F

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	-16	Arm 2

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D2	2023	PM	ONE HOUR	16:45	18:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	1145	100.000
2		ONE HOUR	✓	781	100.000
3		ONE HOUR	✓	423	100.000
4		ONE HOUR	✓	315	100.000
5		ONE HOUR	✓	546	100.000

## Origin-Destination Data

## Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	83.52	F

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	-18	Arm 2

## Traffic Demand

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	10.75	B

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	6	Arm 2

## Traffic Demand

## 2037, OP

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	2.60	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	900	

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D8	2037	OP	ONE HOUR	22:45	00:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	73	100.000

## Data Errors and Warnings

Severity	Area	Item	Description
----------	------	------	-------------

Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	35.09	E

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	-9	Arm 2

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D11	2037 final (incl rats)	IP	ONE HOUR	12:45	14:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	795	100.000
2		ONE HOUR	✓	820	100.000

## 2037 final (incl rats), OP

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS

## 2023LG, AM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	53.82	F

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	-11	Arm 2

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D13	2023LG	AM	ONE HOUR	07:45	09:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	775	100.000
2		ONE HOUR	✓	900	100.000
3		ONE HOUR	✓	453	100.000
4		ONE HOUR	✓	355	100.000
5		ONE HOUR	✓	496	100.000

## Origin-Destination Data

# 2023LG, PM

## Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	43.07	E

## 2023LG, IP

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	8.21	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	14	Arm 2

## Traffic Demand

## 2037LG, AM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	43.43	E

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	-10	Arm 2

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D17	2037LG	AM	ONE HOUR	07:45	09:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	767	100.000
2		ONE HOUR	✓	887	100.000
3		ONE HOUR	✓	434	100.000
4		ONE HOUR	✓	341	100.000

5		ONE HOUR	✓	482	100.000
---	--	----------	---	-----	---------

## Origin-Destination Data

### Demand (PCU/hr)

## 2037LG, PM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	31.43	D

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	-9	Arm 2

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D18	2037LG	PM	ONE HOUR	16:45	18:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

## 2037LG, OP

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	2.59	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	900	

## Traffic Demand

## 2023HG, PM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	120.45	F

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	-21	Arm 2

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D22	2023HG	PM	ONE HOUR	16:45	18:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	1212	100.000
2		ONE HOUR	✓	825	100.000
3		ONE HOUR	✓	445	100.000
4		ONE HOUR	✓	333	100.000
5		ONE HOUR	✓	577	100.000

## Origin-Destination Data

### Demand (PCU/hr)

		To				
		1	2	3	4	5
From	1	3	451	394	297	67
	2	163	3	58	174	427
	3	299	51	0	12	83
	4	181	140	8	0	4
	5	73	403	93	7	1

## Vehicle Mix

### Heavy Vehicle Percentages

		To				
		1	2	3	4	5
From	1	0	0	0	0	0
	2	0	0	0	0	0
	3	0	0	0	0	0
	4	0	0	0	0	0
	5	0	0	0	0	0

## Results

### Results Summary for whole modelled period

Arm	Max RFC	Max Delay (s)	Max Queue (PCU)	Max 95th percentile Queue (PCU)	Max LOS	Average Demand (PCU/hr)	Total Junction Arrivals (PCU)
1	0.83	12.68	4.6	21.7	B	1112	1668
2	1.28	454.60	108.2	158.2	F	757	1136
3	0.65	13.45	1.8	5.4	B	408	613
4	0.71	23.99	2.4	11.6	C	306	458
5	0.56	7.23	1.3	1.9	A	529	794

### Main Results for each time segment

#### 16:45 - 17:00

## 2037HG, AM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	530.14	F

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	-34	Arm 2

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D25	2037HG	AM	ONE HOUR	07:45	09:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	980	100.000

## 2037HG, IP

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	58.99	F

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	-14	Arm 2

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D27	2037HG	IP	ONE HOUR	12:45	14:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

## 2037HG, OP

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	2.67	A

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

**File summary**

**File Description**

Title	Ollerton Roundabout - impt2+xings 2046+psd+tc2
Location	A614/ A616/ A6075 Ollerton
Site number	
Date	12/12/2017
Version	
Status	(new file)
Identifier	
Client	NCC
Jobnumber	
Enumerator	NCCADMIN\br18
Description	

**Units**

Distance units	Speed units	Traffic units input	Traffic units results	Flow units	Average delay units	Total delay units	Rate of delay units
m	kph	PCU	PCU	perHour	s	-Min	perMin

The junction diagram reflects the last run of Junctions.

### Analysis Options

Vehicle length (m)	Calculate Queue Percentiles	Calculate detailed queueing delay	Calculate residual capacity	Residual capacity criteria type	RFC Threshold	Average Delay threshold (s)	Queue threshold (PCU)
5.75	✓		✓	Delay	0.85	36.00	20.00

### Demand Set Summary

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically

### Analysis Set Details

ID	Include in report	Network flow scaling factor (%)	Network capacity scaling factor (%)
A1	✓	100.000	100.000

## 2023, AM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 4 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Pedestrian Crossing	Arm 2 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Pedestrian Crossing	Arm 3 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	5.29	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	33	Arm 2

## Arms

### Arms

Arm	Name	Description
1	A616 Ollerton Rd	
2	A614S Old Rufford Road	
3	A6075 Mansfield Road	
4	A616 Worksop Road	
5	A614N Blyth Road	

### Roundabout Geometry

Arm	V - Approach road half-width (m)	E - Entry width (m)	I' - Effective flare length (m)	R - Entry radius (m)	D - Inscribed circle diameter (m)	PHI - Conflict (entry) angle (deg)	Exit only
1	4.50	8.40	50.0	20.0	60.0	36.0	
2	4.60	8.60	15.0	12.5	60.0	44.0	
3	3.80	8.00	55.0	15.0	60.0	40.0	
4	3.30	8.90	40.0	7.5	60.0	56.0	
5	5.00	8.80	10.0	25.0	60.0	42.0	

### Pelican/Puffin Crossings

Arm	Space between crossing and junc. entry (Signalised) (PCU)	Amber time preceding red (s)	Amber time regarded as green (s)	Time from traffic red start to green man start (s)	Time period green man shown (s)	Clearance Period (s)	Traffic minimum green (s)
2	4.00	3.00	2.90	3.00	6.00	9.00	7.00
3	4.00	3.00	2.90	3.00	6.00	9.00	7.00

### Slope / Intercept / Capacity

#### Roundabout Slope and Intercept used in model

Arm	Final slope	Final intercept (PCU/hr)
1	0.649	2261
2	0.569	1888
3	0.607	2063
4	0.529	1799
5	0.595	1970

The slope and intercept shown above include any corrections and adjustments.

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D1	2023	AM	ONE HOUR	07:45	09:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	817	100.000
2		ONE HOUR	✓	947	100.000
3		ONE HOUR	✓	475	100.000
4		ONE HOUR	✓	375	100.000
5		ONE HOUR	✓	524	100.000

### Demand overview (Pedestrians)

Arm	Profile type	Average pedestrian flow (Ped/hr)

## 2023, PM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 4 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Pedestrian Crossing	Arm 2 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Pedestrian Crossing	Arm 3 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

## 2023, IP

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 4 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Pedestrian Crossing	Arm 2 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Pedestrian Crossing	Arm 3 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	3.61	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	70	Arm 2

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D3	2023	IP	ONE HOUR	12:45	14:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	725	100.000
2		ONE HOUR	✓	682	100.000
3		ONE HOUR	✓	334	100.000

4		ONE HOUR	✓	232	100.000
5		ONE HOUR	✓	399	100.000

### Demand overview (Pedestrians)

Arm	Profile type	Average pedestrian flow (Ped/hr)
1		
2	[ONEHOUR]	0.00
3	[ONEHOUR]	0.00
4		
5		

## Origin-Destination Data

### Demand (PCU/hr)

		To				
		1	2	3	4	5
From	1	1	302	240	130	52

# 2023, OP

## Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 4 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Pedestrian Crossing	Arm 2 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Pedestrian Crossing	Arm 3 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	1.88	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	900	

## Traffic Demand

### Demand Set Details

## 2037, PM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 4 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Pedestrian Crossing	Arm 2 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Pedestrian Crossing	Arm 3 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	6.04	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	24	Arm 1

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D6	2037	PM	ONE HOUR	16:45	18:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	1154	100.000
2		ONE HOUR	✓	802	100.000
3		ONE HOUR	✓	424	100.000
4		ONE HOUR	✓	320	100.000
5		ONE HOUR	✓	553	100.000

### Demand overview (Pedestrians)

Arm	Profile type	Average pedestrian flow (Ped/hr)
1		
2	[ONEHOUR]	0.00
3	[ONEHOUR]	0.00
4		
5		

## Origin-Destination Data

### Demand (PCU/hr)

		To				
		1	2	3	4	5
From	1	3	436	372	280	63
	2	161	3	56	169	413

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 4 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Pedestrian Crossing	Arm 2 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Pedestrian Crossing	Arm 3 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	3.69	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	66	Arm 2

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D7	2037	IP	ONE HOUR	12:45	14:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	739	100.000
2		ONE HOUR	✓	701	100.000
3		ONE HOUR	✓	336	100.000

4		ONE HOUR	✓	237	100.000

## Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 4 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Pedestrian Crossing	Arm 2 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Pedestrian Crossing	Arm 3 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## 2037 final (incl rats), IP

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.

Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 4 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	4.58	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	43	Arm 2

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D11	2037 final (incl rats)	IP	ONE HOUR	12:45	14:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	795	100.000
2		ONE HOUR	✓	820	100.000
3		ONE HOUR	✓	488	100.000
4		ONE HOUR	✓	250	100.000
5		ONE HOUR	✓	436	100.000

### Demand overview (Pedestrians)

Arm	Profile type	Average pedestrian flow (Ped/hr)
1		
2	[ONEHOUR]	15.00
3	[ONEHOUR]	10.00
4		
5		

## Origin-Destination Data

## Demand (PCU/hr)

		To				
		1	2	3	4	5

## 2037 final (incl rats), OP

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 4 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	1.96	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	900	

## Traffic Demand

## 2023LG, PM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 4 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Pedestrian Crossing	Arm 2 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Pedestrian Crossing	Arm 3 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	5.13	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	33	Arm 1

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D14	2023LG	PM	ONE HOUR	16:45	18:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	1080	100.000
2		ONE HOUR	✓	739	100.000
3		ONE HOUR	✓	401	100.000

4		ONE HOUR	✓	298	100.000
5		ONE HOUR	✓	514	100.000

### Demand overview (Pedestrians)

Arm	Profile type	Average pedestrian flow (Ped/hr)
1		
2	[ONEHOUR]	0.00
3	[ONEHOUR]	0.00
4		
5		

## Origin-Destination Data

### Demand (PCU/hr)

		To				
		1	2	3	4	5

## Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 4 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Pedestrian Crossing	Arm 2 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Pedestrian Crossing	Arm 3 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	3.43	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	79	Arm 2

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D15	2023LG	IP	ONE HOUR	12:45	14:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	686	100.000
2		ONE HOUR	✓	647	100.000
3		ONE HOUR	✓	316	100.000
4		ONE HOUR	✓	221	100.000
5		ONE HOUR	✓	378	100.000

### Demand overview (Pedestrians)

Arm	Profile type	Average pedestrian flow (Ped/hr)
1		
2	[ONEHOUR]	0.00
3	[ONEHOUR]	0.00
4		
5		

## Origin-Destination Data

### Demand (PCU/hr)

		To				
		1	2	3	4	5
From	1	1	286	227	123	49
	2	234	2	41	101	269
	3	204	49	0	11	52
	4	119	85	10	0	7
	5	55	266	52	5	0

## Vehicle Mix

## Heavy Vehicle Percentages

From	To				
	1	2	3	4	5

## 2023LG, OP

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 4 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Pedestrian Crossing	Arm 2 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Pedestrian Crossing	Arm 3 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	1.88	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	900	

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D16	2023LG	OP	ONE HOUR	22:45	00:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	67	100.000
2		ONE HOUR	✓	63	100.000
3		ONE HOUR	✓	31	100.000

4		ONE HOUR	✓	22	100.000
5		ONE HOUR	✓	36	100.000

### Demand overview (Pedestrians)

Arm	Profile type	Average pedestrian flow (Ped/hr)
1		
2	[ONEHOUR]	0.00
3	[ONEHOUR]	0.00
4		
5		

## Origin-Destination Data

### Demand (PCU/hr)

		To				
		1	2	3	4	5

## 2037LG, AM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 4 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Pedestrian Crossing	Arm 2 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Pedestrian Crossing	Arm 3 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	4.63	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	42	Arm 2

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D17	2037LG	AM	ONE HOUR	07:45	09:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	767	100.000
2		ONE HOUR	✓	887	100.000
3		ONE HOUR	✓	434	100.000
4		ONE HOUR	✓	341	100.000
5		ONE HOUR	✓	482	100.000

## 2037LG, PM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 4 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Pedestrian Crossing	Arm 2 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Pedestrian Crossing	Arm 3 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

## Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 4 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Pedestrian Crossing	Arm 2 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Pedestrian Crossing	Arm 3 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	3.33	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	85	Arm 2

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D19	2037LG	IP	ONE HOUR	12:45	14:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	665	100.000
2		ONE HOUR	✓	633	100.000
3		ONE HOUR	✓	304	100.000
4		ONE HOUR	✓	211	100.000
5		ONE HOUR	✓	365	100.000

### Demand overview (Pedestrians)

Arm	Profile type	Average pedestrian flow (Ped/hr)
-----	--------------	----------------------------------

1		
2	[ONEHOUR]	0.00
3	[ONEHOUR]	0.00
4

# 2037LG, OP

## Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 4 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.

Warning	Pedestrian Crossing	Arm 2 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Pedestrian Crossing	Arm 3 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	1.88	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	900	

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D20	2037LG	OP	ONE HOUR	22:45	00:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	65	100.000

## 2023HG, PM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 4 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Pedestrian Crossing	Arm 2 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Pedestrian Crossing	Arm 3 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	6.87	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	18	Arm 1

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D22	2023HG	PM	ONE HOUR	16:45	18:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	1212	100.000
2		ONE HOUR	✓	825	100.000
3		ONE HOUR	✓	445	100.000
4		ONE HOUR	✓	333	100.000

## 2023HG, IP

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 4 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Pedestrian Crossing	Arm 2 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Pedestrian Crossing	Arm 3 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	3.82	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	62	Arm 2

## Traffic Demand

### Demand Set Details

## Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 4 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Pedestrian Crossing	Arm 2 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Pedestrian Crossing	Arm 3 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	1.89	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	900	

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D24	2023HG	OP	ONE HOUR	22:45	00:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	74	100.000
2		ONE HOUR	✓	69	100.000
3		ONE HOUR	✓	34	100.000
4		ONE HOUR	✓	24	100.000
5		ONE HOUR	✓	42	100.000

### Demand overview (Pedestrians)

## Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 4 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.

Warning	Pedestrian Crossing	Arm 2 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Pedestrian Crossing	Arm 3 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

## 2037HG, IP

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 4 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Pedestrian Crossing	Arm 2 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Pedestrian Crossing	Arm 3 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	4.92	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	36	Arm 2

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D27	2037HG	IP	ONE HOUR	12:45	14:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	855	100.000
2		ONE HOUR	✓	855	100.000
3		ONE HOUR	✓	520	100.000
4		ONE HOUR	✓	273	100.000
5		ONE HOUR	✓	477	100.000

### Demand overview (Pedestrians)

Arm	Profile type	Average pedestrian flow (Ped/hr)
1		
2	[ONEHOUR]	0.00
3	[ONEHOUR]	0.00

## 2037HG, OP

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	Arm 1 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 3 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	Arm 4 - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Pedestrian Crossing	Arm 2 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Pedestrian Crossing	Arm 3 - Pedestrian crossing	Pedestrian crossing uses default flow of 0. Is this correct?
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout		1, 2, 3, 4, 5	1.91	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	900	

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D28	2037HG	OP	ONE HOUR	22:45	00:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1		ONE HOUR	✓	83	100.000
2		ONE HOUR	✓	84	100.000
3		ONE HOUR	✓	50	100.000
4		ONE HOUR	✓	27	100.000
5		ONE HOUR	✓	46	100.000

### Demand overview (Pedestrians)

Arm	Profile type	Average pedestrian flow (Ped/hr)
1		
2	[ONEHOUR]	0.00
3	[ONEHOUR]	0.00
4		
5		

## Origin-Destination Data

### Demand (PCU/hr)

	To					
	1	2	3	4	5	
From	1	0	34	29	14	6
	2	28	0	12	12	32
	3	27	13	0	2	8
	4	14	10	2	0	1
	5	6	31	8	1	0

## Vehicle Mix

### Heavy Vehicle Percentages

	To					
	1	2	3	4	5	
From	1	0	0	0	0	0
	2	0	0	0	0	0
	3	0	0	0	0	0
	4	0	0	0	0	0
	5	0	0	0	0	0

## Results

### Results Summary for whole modelled period

Arm	Max RFC	Max Delay (s)	Max Queue (PCU)	Max 95th percentile Queue (PCU)	Max LOS	Average Demand (PCU/hr)	Total Junction Arrivals (PCU)
1	0.04	1.69	0.0	0.5	A	76	114
2	0.05	2.05	0.1	0.5	A	77	116
3	0.03	1.91	0.0	0.5	A	46	69

4	0.02	2.11	0.0	0.5	A	25	37
5	0.03	1.94	0.0	0.5	A	42	63

## Main Results for each time segment

### 22:45 - 23:00

Arm	Total Demand (PCU/hr)	Junction Arrivals (PCU)	Circulating flow (PCU/hr)	Pedestrian demand (Ped/hr)	Capacity (PCU/hr)	RFC	Throughput (PCU/hr)	Throughput (exit side) (PCU/hr)	Start queue (PCU)	End queue (PCU)	Delay (s)	Unsignalised level of service
1	62	16	49		2229	0.028	62	56	0.0	0.0	1.660	A
2	63	16	45	0.00	1863	0.034	63	66	0.0	0.0	2.000	A

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

## File summary

### File Description

Title	A614/ A617 impts
Location	A614/ Mickledale Lane
Site number	J2
Date	22/11/2017
Version	
Status	(new file)
Identifier	
Client	
Jobnumber	
Enumerator	NCCADMIN\br18
Description	

## Units

Distance units	Speed units	Traffic units input	Traffic units results	Flow units	Average delay units	Total delay units	Rate of delay units
----------------	-------------	---------------------	-----------------------	------------	---------------------	-------------------	---------------------

m	kph	PCU	PCU	perHour	s	-Min	perMin

The junction diagram reflects the last run of Junctions.

### Analysis Options

Vehicle length (m)	Calculate Queue Percentiles	Calculate detailed queueing delay	Calculate residual capacity	Residual capacity criteria type	RFC Threshold	Average Delay threshold (s)	Queue threshold (PCU)
5.75	✓		✓	Delay	0.85	36.00	20.00

### Analysis Set Details

ID	Include in report	Network flow scaling factor (%)	Network capacity scaling factor (%)
A1	✓	100.000	100.000

## 2023, AM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Queue variations	Analysis Options	Queue Variations cannot be calculated for crossroads.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
1	untitled	Crossroads	Two-way		1.22	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	11	Stream B-AD

## Arms

### Arms

Arm	Name	Description	Arm type
A	A614N		Major
B	Deerdale Lane E		Minor
C	A614S		Major
D	Deerdale Lane W		Minor

## Major Arm Geometry

Arm	Width of carriageway (m)	Has kerbed central reserve	Has right turn bay	Width for right turn (m)	Visibility for right turn (m)	Blocks?	Blocking queue (PCU)
A	11.00		✓	3.50	220.0	✓	20.00
C	11.00		✓	3.50	150.0	✓	25.00

Geometries for Arm C are measured opposite Arm B. Geometries for Arm A (if relevant) are measured opposite Arm D.

## Minor Arm Geometry

Arm	Minor arm type	Lane width (m)	Width at give-way (m)	Width at 5m (m)	Width at 10m (m)	Width at 15m (m)	Width at 20m (m)	Estimate flare length	Flare length (PCU)	Visibility to left (m)	Visibility to right (m)
B	One lane plus flare		10.00	10.00	7.20	4.90	3.30		1.00	110	195
D	One lane	3.00								130	50

## Slope / Intercept / Capacity

### Priority Intersection Slopes and Intercepts

Stream	Intercept (PCU/hr)	Slope for A-B	Slope for A-C	Slope for A-D	Slope for B-A	Slope for B-C	Slope for B-D	Slope for C-A	Slope for C-B	Slope for C-D	Slope for D-A	Slope for D-B	Slope for D-C
A-D	801	-	-	-	-	-	-	0.243	0.347	0.243	-	-	-
B-A	665	0.095	0.239	0.239	-	-	-	0.151	0.342	-	0.239	0.239	0.120
B-C	836	0.100	0.253	-	-	-	-	-	-	-	-	-	-
B-D, nearside lane	686	0.098	0.247	0.247	-	-	-	0.156	0.353	0.156	-	-	-
B-D, offside lane	665	0.095	0.239	0.239	-	-	-	0.151	0.342	0.151	-	-	-
C-B	754	0.229	0.229	0.327	-	-	-	-	-	-	-	-	-
D-A	655	-	-	-	-	-	-	0.199	-	0.079	-	-	-
D-B, nearside lane	545	0.124	0.124	0.280	-	-	-	0.196	0.196	0.078	-	-	-
D-B, offside lane	545	0.124	0.124	0.280	-	-	-	0.196	0.196	0.078	-	-	-
D-C	545	-	0.124	0.280	0.098	0.196	0.196	0.196	0.196	0.078	-	-	-

The slopes and intercepts shown above do NOT include any corrections or adjustments.

Streams may be combined, in which case capacity will be adjusted.

Values are shown for the first time segment only; they may differ for subsequent time segments.

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D1	2023	AM	ONE HOUR	07:45	09:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
A		ONE HOUR	✓	1076	100.000
B		ONE HOUR	✓	127	100.000
C		ONE HOUR	✓	944	100.000
D		ONE HOUR	✓	8	100.000

## Origin-Destination Data

## Demand (PCU/hr)

From	To			
	A	B	C	D
A	0	91	980	5
B	56	0	71	0
C	867	71	0	6
D	4	0	4	0

## Vehicle Mix

### Heavy Vehicle Percentages

From	To			
	A	B	C	D
A	0	0	0	0
B	0	0	0	0
C	0	0	0	0
D	0	0	0	0

## Results

### Results Summary for whole modelled period

Stream	Max RFC	Max Delay (s)	Max Queue (PCU)	Max 95th percentile Queue (PCU)	Max LOS	Average Demand (PCU/hr)	Total Junction Arrivals (PCU)

## 2023, PM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Queue variations	Analysis Options	Queue Variations cannot be calculated for crossroads.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
1	untitled	Crossroads	Two-way		1.25	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	15	Stream B-AD

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D2	2023	PM	ONE HOUR	16:45	18:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
A		ONE HOUR	✓	956	100.000

B		ONE HOUR	✓	148	100.000
C		ONE HOUR	✓	963	100.000
D		ONE HOUR	✓	8	100.000

## Origin-Destination Data

### Demand (PCU/hr)

		To				
		A	B	C	D	
From	A	0	63	892	1	
	B	69	0	76	3	
	C	902	48	0	13	
	D	4	3	1	0	

## Vehicle Mix

### Heavy Vehicle Percentages

		To				
		A	B	C	D	
From	A	0	0	0	0	
	B	0	0	0	0	
	C	0	0	0	0	
	D	0	0	0	0	

## Results

### Results Summary for whole modelled period

Stream	Max RFC	Max Delay (s)	Max Queue (PCU)	Max 95th percentile Queue (PCU)	Max LOS	Average Demand (PCU/hr)	Total Junction Arrivals (PCU)

## 2023, IP

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Queue variations	Analysis Options	Queue Variations cannot be calculated for crossroads.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

## 2023, OP

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Queue variations	Analysis Options	Queue Variations cannot be calculated for crossroads.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
1	untitled	Crossroads	Two-way		0.59	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	900	

## Traffic Demand

## 2037, OP

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Queue variations	Analysis Options	Queue Variations cannot be calculated for crossroads.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
1	untitled	Crossroads	Two-way		0.57	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	900	

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D8	2037	OP	ONE HOUR	22:45	00:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
A		ONE HOUR	✓	66	100.000
B		ONE HOUR	✓	11	100.000
C		ONE HOUR	✓	64	100.000
D		ONE HOUR	✓	0	100.000

## Origin-Destination Data

### Demand (PCU/hr)

From	To			
	A	B	C	D
A	0	6	60	0
B	6	0	5	0
C	59	5	0	0
D	0	0	0	0

## Vehicle Mix

### Heavy Vehicle Percentages

From	To			
	A	B	C	D
A	0	0	0	0
B	0	0	0	0
C	0	0	0	0
D	0	0	0	0

## Results

### Results Summary for whole modelled period

Stream	Max RFC	Max Delay (s)	Max Queue (PCU)	Max 95th percentile Queue (PCU)	Max LOS	Average Demand (PCU/hr)	Total Junction Arrivals (PCU)
B-CD	0.01	4.57	0.0	0.5	A	5	7
B-AD	0.01	5.55	0.0	0.5	A	6	8
A-BCD	0.00	0.00	0.0	~1	A	0	0
A-B						6	8
A-C						55	83
D-ABC	0.00	0.00	0.0	~1	A	0	0
C-ABD	0.01	4.92	0.0	0.5	A	5	7
C-D						0	0
C-A						54	81

## 2037+dependent, AM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Queue variations	Analysis Options	Queue Variations cannot be calculated for crossroads.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
1	untitled	Crossroads	Two-way		1.94	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	-5	Stream B-AD

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D9	2037+dependent	AM	ONE HOUR	07:45	09:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
A		ONE HOUR	✓	1280	100.000
B		ONE HOUR	✓	137	100.000
C		ONE HOUR	✓	1083	100.000

D		ONE HOUR	✓	8	100.000
---	--	----------	---	---	---------

## Origin-Destination Data

### Demand (PCU/hr)

From	To			
	A	B	C	D
A	0	104	1170	6
B	63	0	74	0
C	1003	74	0	6
D	4	0	4	0

## Vehicle Mix

### Heavy Vehicle Percentages

From	To			
	A	B	C	D
A	0	5	15	2
B	2	0	2	0
C	15	5	0	2
D	2	0	2	0

## Results

### Results Summary for whole modelled period

Stream	Max RFC	Max Delay (s)	Max Queue (PCU)	Max 95th percentile Queue (PCU)	Max LOS	Average Demand (PCU/hr)	Total Junction Arrivals (PCU)
B-CD	0.21	11.98	0.3	1.2	B	68	102
B-AD	0.47	47.39	0.9	4.0	E	58	87

## Queue Variation Results for each time segment

### 22:45 - 23:00

Stream	Mean (PCU)	Q05 (PCU)	Q50 (PCU)	Q90 (PCU)	Q95 (PCU)	Percentile message	Marker message	Probability of reaching or exceeding marker	Probability of exactly reaching marker
B-CD	0.00	0.00	0.00	0.00	0.00			N/A	N/A
B-AD	0.01	0.00	0.00	0.01	0.01			N/A	N/A
A-BCD	0.00	0.00	0.00	0.00	0.00			N/A	N/A
D-ABC	0.00	0.00	0.00	0.00	0.00			N/A	N/A
C-ABD	0.01	0.00	0.00	0.01	0.01			N/A	N/A

### 23:00 - 23:15

Stream	Mean (PCU)	Q05 (PCU)	Q50 (PCU)	Q90 (PCU)	Q95 (PCU)	Percentile message	Marker message	Probability of reaching or exceeding marker	Probability of exactly reaching marker
B-CD	0.01	0.01	0.25	0.45	0.48			N/A	N/A
B-AD	0.01	0.01	0.25	0.45	0.48			N/A	N/A
A-BCD	0.00	0.00	0.00	0.00	0.00			N/A	N/A
D-ABC	0.00	0.00	0.00	0.00	0.00			N/A	N/A
C-ABD	0.01	0.01	0.25	0.45	0.48			N/A	N/A

### 23:15 - 23:30

Stream	Mean (PCU)	Q05 (PCU)	Q50 (PCU)	Q90 (PCU)	Q95 (PCU)	Percentile message	Marker message	Probability of reaching or exceeding marker	Probability of exactly reaching marker
B-CD	0.01	0.00	0.00	0.01	0.01			N/A	N/A
B-AD	0.01	0.00	0.00	0.01	0.01			N/A	N/A
A-BCD	0.00	0.00	0.00	0.00	0.00			N/A	N/A
D-ABC	0.00	0.00	0.00	0.00	0.00			N/A	N/A
C-ABD	0.01	0.00	0.00	0.01	0.01			N/A	N/A

### 23:30 - 23:45

Stream	Mean (PCU)	Q05 (PCU)	Q50 (PCU)	Q90 (PCU)	Q95 (PCU)	Percentile message	Marker message	Probability of reaching or exceeding marker	Probability of exactly reaching marker
B-CD	0.01	0.00	0.00	0.01	0.01			N/A	N/A
B-AD	0.01	0.00	0.00	0.01	0.01			N/A	N/A
A-BCD	0.00	0.00	0.00	0.00	0.00			N/A	N/A
D-ABC	0.00	0.00	0.00	0.00	0.00			N/A	N/A
C-ABD	0.01	0.00	0.00	0.01	0.01			N/A	N/A

### 23:45 - 00:00

Stream	Mean (PCU)	Q05 (PCU)	Q50 (PCU)	Q90 (PCU)	Q95 (PCU)	Percentile message	Marker message	Probability of reaching or exceeding marker	Probability of exactly reaching marker
B-CD	0.01	0.00	0.00	0.01	0.01			N/A	N/A
B-AD	0.01	0.00	0.00	0.01	0.01			N/A	N/A
A-BCD	0.00	0.00	0.00	0.00	0.00			N/A	N/A
D-ABC	0.00	0.00	0.00	0.00	0.00			N/A	N/A
C-ABD	0.01	0.00	0.00	0.01	0.01			N/A	N/A

### 00:00 - 00:15

Stream	Mean (PCU)	Q05 (PCU)	Q50 (PCU)	Q90 (PCU)	Q95 (PCU)	Percentile message	Marker message	Probability of reaching or exceeding marker	Probability of exactly reaching marker
B-CD	0.00	0.00	0.00	0.00	0.00			N/A	N/A
B-AD	0.01	0.00	0.00	0.01	0.01			N/A	N/A
A-BCD	0.00	0.00	0.00	0.00	0.00			N/A	N/A
D-ABC	0.00	0.00	0.00	0.00	0.00			N/A	N/A
C-ABD	0.01	0.00	0.00	0.01	0.01			N/A	N/A

## 2023LG, AM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Queue variations	Analysis Options	Queue Variations cannot be calculated for crossroads.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
1	untitled	Crossroads	Two-way		1.12	A

## Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	17	Stream B-AD

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D13	2023LG	AM	ONE HOUR	07:45	09:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
A		ONE HOUR	✓	1021	100.000
B		ONE HOUR	✓	121	100.000
C		ONE HOUR	✓	895	100.000
D		ONE HOUR	✓	8	100.000

## Origin-Destination Data

### Demand (PCU/hr)

		To			
		A	B	C	D
From	A	0	86	930	5
	B	54	0	67	0
	C	822	67	0	6
	D	4	0	4	0

## Vehicle Mix

### Heavy Vehicle Percentages

		To			
		A	B	C	D
From	A	0	0	0	0
	B	0	0	0	0
	C	0	0	0	0
	D	0	0	0	0

## Results

### Results Summary for whole modelled period

Stream	Max RFC	Max Delay (s)	Max Queue (PCU)	Max 95th percentile Queue (PCU)	Max LOS	Average Demand (PCU/hr)	Total Junction Arrivals (PCU)
B-CD	0.14	8.01	0.2	0.5	A	61	92
B-AD	0.24	19.37	0.3	1.4	C	50	74

## 2023LG, PM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Queue variations	Analysis Options	Queue Variations cannot be calculated for crossroads.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
1	untitled	Crossroads	Two-way		1.13	A

### Junction Network Options

# 2023LG, IP

## Data Errors and Warnings

Severity	Area	Item	Description
Warning	Queue variations	Analysis Options	Queue Variations cannot be calculated for crossroads.

Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
1	untitled	Crossroads	Two-way		0.99	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	73	Stream B-AD

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D15	2023LG	IP	ONE HOUR	12:45	14:15	15	✓

## 2037LG, AM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Queue variations	Analysis Options	Queue Variations cannot be calculated for crossroads.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
1	untitled	Crossroads	Two-way		1.10	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	19	Stream B-AD

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D17	2037LG	AM	ONE HOUR	07:45	09:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
A		ONE HOUR	✓	1007	100.000

B		ONE HOUR	✓	120	100.000
C		ONE HOUR	✓	883	100.000
D		ONE HOUR	✓	8	100.000

## Origin-Destination Data

### Demand (PCU/hr)

		To			
		A	B	C	D
From	A	0	84	918	5
	B	54	0	66	0
	C	811	66	0	6
	D	4	0	4	0

## Vehicle Mix

### Heavy Vehicle Percentages

		To			
		A	B	C	D
From	A	0	0	0	0
	B	0	0	0	0
	C	0	0	0	0
	D	0	0	0	0

## Results

### Results Summary for whole modelled period

Stream	Max RFC	Max Delay (s)	Max Queue (PCU)	Max 95th percentile Queue (PCU)	Max LOS	Average Demand (PCU/hr)	Total Junction Arrivals (PCU)
B-CD	0.14	7.92	0.2	0.5	A	61	91
B-AD	0.24	18.78	0.3	1.4	C	50	74
A-BCD	0.01	6.53	0.0	0.5	A	5	7
A-B						77	116
A-C						842	1264

## 2037LG, PM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Queue variations	Analysis Options	Queue Variations cannot be calculated for crossroads.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
1	untitled	Crossroads	Two-way		1.09	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	25	Stream B-AD

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D18	2037LG	PM	ONE HOUR	16:45	18:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
A		ONE HOUR	✓	883	100.000
B		ONE HOUR	✓	136	100.000
C		ONE HOUR	✓	886	100.000
D		ONE HOUR	✓	8	100.000

## Origin-Destination Data

### Demand (PCU/hr)

	To			
	A	B	C	D
From A	0	60	822	1
From B	64	0	69	3
From C	830	44	0	12
From D	4	3	1	0

## Vehicle Mix

### Heavy Vehicle Percentages

	To			
	A	B	C	D
From A	0	0	0	0
From B	0	0	0	0
From C	0	0	0	0
From D	0	0	0	0

## Results

### Results Summary for whole modelled period

Stream	Max RFC	Max Delay (s)	Max Queue (PCU)	Max 95th percentile Queue (PCU)	Max LOS	Average Demand (PCU/hr)	Total Junction Arrivals (PCU)
B-CD	0.15	7.95	0.2	0.5	A	65	97

# 2023HG, PM

## Data Errors and Warnings

Severity	Area	Item	Description
Warning	Queue variations	Analysis Options	Queue Variations cannot be calculated for crossroads.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
1	untitled	Crossroads	Two-way		1.41	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	9	Stream B-AD

## Traffic Demand

## Data Errors and Warnings

Severity	Area	Item	Description
Warning	Queue variations	Analysis Options	Queue Variations cannot be calculated for crossroads.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
1	untitled	Crossroads	Two-way		0.59	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	900	

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D24	2023HG	OP	ONE HOUR	22:45	00:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
A		ONE HOUR	✓	67	100.000
B		ONE HOUR	✓	12	100.000
C		ONE HOUR	✓	65	100.000
D		ONE HOUR	✓	0	100.000

## Origin-Destination Data

### Demand (PCU/hr)

		To			
		A	B	C	D
From	A	0	6	61	0
	B	6	0	6	0
	C	60	5	0	0
	D	0	0	0	0

## Vehicle Mix

### Heavy Vehicle Percentages

		To			
		A	B	C	D
From	A	0	0	0	0
	B	0	0	0	0
	C	0	0	0	0
	D	0	0	0	0

## Results

### Results Summary for whole modelled period

Stream	Max RFC	Max Delay (s)	Max Queue (PCU)	Max 95th percentile Queue (PCU)	Max LOS	Average Demand (PCU/hr)	Total Junction Arrivals (PCU)

# 2037HG, PM

## Data Errors and Warnings

Severity	Area	Item	Description
Warning	Queue variations	Analysis Options	Queue Variations cannot be calculated for crossroads.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
1	untitled	Crossroads	Two-way		5.04	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	-11	Stream B-AD

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D26	2037HG	PM	ONE HOUR	16:45	18:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)

## 2037HG, IP

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Queue variations	Analysis Options	Queue Variations cannot be calculated for crossroads.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
1	untitled	Crossroads	Two-way		1.19	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	31	Stream B-AD

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D27	2037HG	IP	ONE HOUR	12:45	14:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

# Appendix U – Mickledale Lane Scheme Drawing and PICADY/LINSIG Outputs

- NOTES**
1. This drawing is to be read in conjunction with all other relevant drawings, details and specifications.
  2. Do not scale from this drawing.
  3. All measurements are given in metres unless otherwise stated.
  4. This drawing shows the draft general arrangement for the proposed upgrade of the existing right turn ghost island junction arrangement to a signalised junction. Tracking movements have been included on this drawing to show the relevant and suggested arrangements for access and egress to the 4 houses SE of the junction and to the Lime's Cafe. These proposals are only indicative in nature and actual arrangements are to be confirmed following further discussions with affected property owners, affected land owners, AIU, traffic signals and the District Manager.
  5. The existing carriageway is to be widened to accommodate additional lanes and traffic islands. It is suggested the widening is restricted to the western side. The adjoining land affected is of agricultural and car park (Lime's Cafe) use.
  6. New verges up to 3.0m wide are to be constructed alongside the carriageway widening, affected underground services could be diverted in to these areas. These areas of private land are to be acquired by the Local Highway Authority for the proposed highway improvements.

- KEY**
- Carriageway Construction
  - Proposed Traffic Islands
  - Footway Construction
  - Proposed Verges
  - Proposed Access Road for the 4 Properties

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

## File summary

## Analysis Set Details

ID	Include in report	Network flow scaling factor (%)	Network capacity scaling factor (%)
A1	✓	100.000	100.000

# 2023, AM

## Data Errors and Warnings

Severity	Area	Item	Description
Warning	Queue variations	Analysis Options	Queue Variations cannot be calculated for crossroads.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

# Junction Network

## Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
1	untitled	Crossroads	Two-way		1.86	A

## Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	1	Stream B-AD

# Arms

## Arms

Arm	Name	Description	Arm type
A	A614N		Major
B	Mickledale Lane E		Minor
C	A614S		Major
D	Mickledale Lane W		Minor

## Major Arm Geometry

Arm	Width of carriageway (m)	Has kerbed central reserve	Has right turn bay	Width for right turn (m)	Visibility for right turn (m)	Blocks?	Blocking queue (PCU)
A	10.00		✓	3.00	150.0	✓	8.00
C	10.00		✓	3.00	150.0	✓	20.00

Geometries for Arm C are measured opposite Arm B. Geometries for Arm A (if relevant) are measured opposite Arm D.

## Minor Arm Geometry

Arm	Minor arm type	Lane width (m)	Width at give-way (m)	Width at 5m (m)	Width at 10m (m)	Width at 15m (m)	Width at 20m (m)	Estimate flare length	Flare length (PCU)	Visibility to left (m)	Visibility to right (m)
B	One lane plus flare		10.00	8.00	5.00	3.90	3.70		1.00	60	85
D	One lane	3.00								150	65

## Slope / Intercept / Capacity

### Priority Intersection Slopes and Intercepts

Stream	Intercept (PCU/hr)	Slope for A-B	Slope for A-C	Slope for A-D	Slope for B-A	Slope for B-C	Slope for B-D	Slope for C-A	Slope for C-B	Slope for C-D	Slope for D-A	Slope for D-B	Slope for D-C
A-D	718	-	-	-	-	-	-	0.230	0.328	0.230	-	-	-
B-A	538	0.081	0.205	0.205	-	-	-	0.129	0.292	-	0.205	0.205	0.102
B-C	768	0.097	0.246	-	-	-	-	-	-	-	-	-	-
B-D, nearside lane	611	0.092	0.232	0.232	-	-	-	0.146	0.332	0.146	-	-	-
B-D, offside lane	538	0.081	0.205	0.205	-	-	-	0.129	0.292	0.129	-	-	-
C-B	718	0.230	0.230	0.328	-	-	-	-	-	-	-	-	-
D-A	665	-	-	-	-	-	-	0.213	-	0.084	-	-	-
D-B, nearside lane	560	0.134	0.134	0.304	-	-	-	0.213	0.213	0.084	-	-	-
D-B, offside lane	560	0.134	0.134	0.304	-	-	-	0.213	0.213	0.084	-	-	-
D-C	560	-	0.134	0.304	0.106	0.213	0.213	0.213	0.213	0.084	-	-	-

The slopes and intercepts shown above do NOT include any corrections or adjustments.

Streams may be combined, in which case capacity will be adjusted.

Values are shown for the first time segment only; they may differ for subsequent time segments.

# Traffic Demand

## Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D1	2023	AM	ONE HOUR	07:45	09:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

## Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
A		ONE HOUR	✓	1046	100.000
B		ONE HOUR	✓	192	100.000
C		ONE HOUR	✓	983	100.000
D		ONE HOUR	✓	6	100.000

## Origin-Destination Data

# 2037, PM

**Data Errors and Warnings**

Severity	Area	Item	Description
Warning	Queue variations	Analysis Options	Queue Variations cannot be calculated for crossroads.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
1	untitled	Crossroads	Two-way		2.07	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	-1	Stream B-AD

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D6	2037	PM	ONE HOUR	16:45	18:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
A		ONE HOUR	✓	979	100.000
B		ONE HOUR	✓	172	100.000
C		ONE HOUR	✓	1117	100.000
D		ONE HOUR	✓	3	100.000

## Origin-Destination Data

### Demand (PCU/hr)

		To			
		A	B	C	D
From	A	0	58	919	2

# 2023LG, AM

## Data Errors and Warnings

Severity	Area	Item	Description
Warning	Queue variations	Analysis Options	Queue Variations cannot be calculated for crossroads.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
1	untitled	Crossroads	Two-way		1.68	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	6	Stream B-AD

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D13	2023LG	AM	ONE HOUR	07:45	09:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
A		ONE HOUR	✓	994	100.000
B		ONE HOUR	✓	184	100.000
C		ONE HOUR	✓	933	100.000
D		ONE HOUR	✓	6	100.000

## Origin-Destination Data

### Demand (PCU/hr)

		To			
		A	B	C	D
From	A	0	32	961	1
	B	34	0	149	1
	C	853	66	0	14
	D	2	2	2	0

## Vehicle Mix

### Heavy Vehicle Percentages

		To			
		A	B	C	D
From	A	0	2	15	10
	B	2	0	2	0
	C	15	5	0	10
	D	2	0	15	0

## Results

## Results Summary for whole modelled period

Stream	Max RFC	Max Delay (s)	Max Queue (PCU)	Max 95th percentile Queue (PCU)	Max LOS	Average Demand (PCU/hr)	Total Junction Arrivals (PCU)
B-CD	0.35	12.23	0.6	2.6	B	137	206
B-AD	0.23	28.26	0.3	1.3	D	32	47
A-BCD	0.00	8.36	0.0	0.5	A	0.92	1
A-B						29	44

# 2023LG, PM

## Data Errors and Warnings

Severity	Area	Item	Description
Warning	Queue variations	Analysis Options	Queue Variations cannot be calculated for crossroads.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
1	untitled	Crossroads	Two-way		1.81	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	8	Stream B-AD

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D14	2023LG	PM	ONE HOUR	16:45	18:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
A		ONE HOUR	✓	904	100.000
B		ONE HOUR	✓	160	100.000
C		ONE HOUR	✓	1034	100.000
D		ONE HOUR	✓	3	100.000

## Origin-Destination Data

### Demand (PCU/hr)

		To			
		A	B	C	D
From	A	0	55	847	2
	B	27	0	133	0
	C	884	146	0	4
	D	0	1	2	0

## Vehicle Mix

### Heavy Vehicle Percentages

		To			
		A	B	C	D
From	A	0	2	15	10
	B	2	0	2	0
	C	15	5	0	10
	D	2	0	15	0

## Results

## Results Summary for whole modelled period

Stream	Max RFC	Max Delay (s)	Max Queue (PCU)	Max 95th percentile Queue (PCU)	Max LOS	Average Demand (PCU/hr)	Total Junction Arrivals (PCU)
B-CD	0.29	10.25	0.4	1.6	B	122	183
B-AD	0.18	27.22	0.2	1.0	D	25	37

# 2023HG, PM

## Data Errors and Warnings

Severity	Area	Item	Description
Warning	Queue variations	Analysis Options	Queue Variations cannot be calculated for crossroads.
Warning	Queue variations	Analysis Options	Queue percentiles may be unreliable if the mean queue in any time segment is very low or very high.

## Junction Network

### Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
1	untitled	Crossroads	Two-way		2.29	A

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	-4	Stream B-AD

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D22	2023HG	PM	ONE HOUR	16:45	18:15	15	✓

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
A		ONE HOUR	✓	1013	100.000
B		ONE HOUR	✓	179	100.000
C		ONE HOUR	✓	1157	100.000
D		ONE HOUR	✓	3	100.000

## Origin-Destination Data

### Demand (PCU/hr)

		To			
		A	B	C	D
From	A	0	62	949	2
	B	31	0	148	0
	C	990	162	0	5
	D	0	1	2	0

## Vehicle Mix

### Heavy Vehicle Percentages

		To			
		A	B	C	D
From	A	0	2	15	10
	B	2	0	2	0
	C	15	5	0	10
	D	2	0	15	0

## Results

## Results Summary for whole modelled period

Stream	Max RFC	Max Delay (s)	Max Queue (PCU)	Max 95th percentile Queue (PCU)	Max LOS	Average Demand (PCU/hr)	Total Junction Arrivals (PCU)

# Appendix V – Lowdham Scheme Drawing and ARCADY Outputs

**NOTES**

1. This drawing is to be read in conjunction with all other relevant drawings, details and specifications.
2. Do not scale from this drawing.
3. All measurements are given in metres unless otherwise stated.

**KEY**

-  Proposed carriageway
-  Proposed footway
-  Proposed grass verge
-  Proposed access road
-  New boundary fence and gate to property 15

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

## File summary

### File Description

<b>Title</b>	Southwell Road / A6097 / Nottingham Road / Epperstone By-Pass
<b>Location</b>	Gedling, Nottingham
<b>Site number</b>	Junction 11
<b>Date</b>	04/04/2013
<b>Version</b>	
<b>Status</b>	Existing Layout
<b>Identifier</b>	
<b>Client</b>	
<b>Jobnumber</b>	90372
<b>Enumerator</b>	T Nichol
<b>Description</b>	

## Units

Distance units	Speed units	Traffic units input	Traffic units results	Flow units	Average delay units	Total delay units	Rate of delay units
m	kph	PCU	PCU	perHour	s	-Min	perMin

### Analysis Set Details

ID	Name	Include in report	Network flow scaling factor (%)	Network capacity scaling factor (%)
A1	Existing Layout	✓	100.000	100.000

## Existing Layout - 2023, AM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Demand Sets	D1 - 2023, AM	Time results are shown for central hour only. (Model is run for a 90 minute period.)
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	Junction 11	Standard Roundabout		2, 3, 4, 1	24.62	C

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	-4	2 - Southwell Road

## Arms

### Arms

Arm	Name	Description
2	Southwell Road	
3	A6097	
4	Nottingham Road	
1	Epperstone By-Pass	

### Roundabout Geometry

Arm	V - Approach road half-width (m)	E - Entry width (m)	I' - Effective flare length (m)	R - Entry radius (m)	D - Inscribed circle diameter (m)	PHI - Conflict (entry) angle (deg)	Exit only
2 - Southwell Road	3.50	5.40	10.0	48.8	42.3	48.0	
3 - A6097	6.70	6.70	0.0	26.3	42.3	36.0	
4 - Nottingham Road	3.70	6.50	10.0	27.5	42.3	29.0	
1 - Epperstone By-Pass	6.70	6.70	0.0	26.2	42.3	16.0	

## Slope / Intercept / Capacity

### Roundabout Slope and Intercept used in model

Arm	Final slope	Final intercept (PCU/hr)
2 - Southwell Road	0.561	1371
3 - A6097	0.695	2012
4 - Nottingham Road	0.620	1595
1 - Epperstone By-Pass	0.744	2152

The slope and intercept shown above include any corrections and adjustments.

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Results for central hour only	Run automatically
D1	2023	AM	ONE HOUR	07:45	09:15	15	✓	✓

Vehicle mix source	PCU Factor for a HV (PCU)
HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
2 - Southwell Road		ONE HOUR	✓	412	100.000
3 - A6097		ONE HOUR	✓	1214	100.000
4 - Nottingham Road		ONE HOUR	✓	705	100.000
1 - Epperstone By-Pass		ONE HOUR	✓	1320	100.000

## Origin-Destination Data

### Data Errors and Warnings

Severity	Area	Item	Description
----------	------	------	-------------

Warning	Demand Sets	D5 - 2037, AM	Time results are shown for central hour only. (Model is run for a 90 minute period.)
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	Junction 11	Standard Roundabout		2, 3, 4, 1	40.22	E

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	-8	2 - Southwell Road

## Traffic Demand

### Demand Set Details

### Data Errors and Warnings

Severity	Area	Item	Description
----------	------	------	-------------

Warning	Demand Sets	D17 - 2037LG, AM	Time results are shown for central hour only. (Model is run for a 90 minute period.)
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	Junction 11	Standard Roundabout		2, 3, 4, 1	14.65	B

### Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	2	2 - Southwell Road

## Traffic Demand

### Demand Set Details

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages.

## File summary

### File Description

Title	A6097/ A612 rdbt 45/50m ICD - final
Location	Lowdham
Site number	Junction 11
Date	04/04/2013
Version	
Status	45-50m ICD
Identifier	
Client	
Jobnumber	90372
Enumerator	T Nichol
Description	

## Units

Distance units	Speed units	Traffic units input	Traffic units results	Flow units	Average delay units	Total delay units	Rate of delay units
m	kph	PCU	PCU	perHour	s	-Min	perMin

## Analysis Options

Vehicle length (m)	Calculate Queue Percentiles	Calculate detailed queueing delay	Calculate residual capacity	RFC Threshold	Average Delay threshold (s)	Queue threshold (PCU)
5.75				0.85	36.00	20.00

### Analysis Set Details

ID	Name	Include in report	Network flow scaling factor (%)	Network capacity scaling factor (%)
A1	Proposed Layout	✓	100.000	100.000

## Proposed Layout - 2023, AM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Demand Sets	D1 - 2023, AM	Time results are shown for central hour only. (Model is run for a 90 minute period.)
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	Junction 6	Standard Roundabout		1, 2, 3, 4	12.35	B

## Junction Network Options

Driving side	Lighting
Left	Normal/unknown

## Arms

### Arms

Arm	Name	Description
1	Epperstone By-Pass	
2	Southwell Road	
3	A6097	
4	Nottingham Road	

### Roundabout Geometry

Arm	V - Approach road half-width (m)	E - Entry width (m)	I' - Effective flare length (m)	R - Entry radius (m)	D - Inscribed circle diameter (m)	PHI - Conflict (entry) angle (deg)	Exit only
1 - Epperstone By-Pass	7.20	7.20	0.0	29.0	45.0	35.0	
2 - Southwell Road	3.50	7.00	10.0	43.0	50.0	35.0	
3 - A6097	7.00	7.00	0.0	22.0	45.0	30.0	
4 - Nottingham Road	7.00	10.50	20.0	50.0	50.0	45.0	

### Slope / Intercept / Capacity

#### Roundabout Slope and Intercept used in model

Arm	Final slope	Final intercept (PCU/hr)
1 - Epperstone By-Pass	0.720	2177
2 - Southwell Road	0.587	1574
3 - A6097	0.713	2130
4 - Nottingham Road	0.798	2737

The slope and intercept shown above include any corrections and adjustments.

## Traffic Demand

### Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Results for central hour only	Run automatically
D1	2023	AM	ONE HOUR	07:45	09:15	15	✓	✓

Vehicle mix source	PCU Factor for a HV (PCU)
HV Percentages	2.00

### Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1 - Epperstone By-Pass		ONE HOUR	✓	1320	100.000
2 - Southwell Road		ONE HOUR	✓	412	100.000
3 - A6097		ONE HOUR	✓	1214	100.000
4 - Nottingham Road		ONE HOUR	✓	705	100.000

## Origin-Destination Data

## Demand (PCU/hr)

	To			
	1 - Epperstone By-Pass	2 - Southwell Road	3 - A6097	4 - Nottingham Road
From 1 - Epperstone By-Pass	2	175	779	364
From 2 - Southwell Road	75	0	78	259
From 3 - A6097	792	122	0	300
From 4 - Nottingham Road	240	206	258	1

## Vehicle Mix

### Heavy Vehicle Percentages

	To			
	1 - Epperstone By-Pass	2 - Southwell Road	3 - A6097	4 - Nottingham Road
From 1 - Epperstone By-Pass	0	0	0	0
From 2 - Southwell Road	0	0	0	0
From 3 - A6097	0	0	0	0
From 4 - Nottingham Road	0	0	0	0

## Results

### Results Summary for whole modelled period

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Demand Sets	D5 - 2037, AM	Time results are shown for central hour only. (Model is run for a 90 minute period.)
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	Junction 6	Standard Roundabout		1, 2, 3, 4	17.09	C

### Junction Network Options

Driving side	Lighting
Left	Normal/unknown

## Proposed Layout - 2037 final, AM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Demand Sets	D9 - 2037 final, AM	Time results are shown for central hour only. (Model is run for a 90 minute period.)
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.

## Junction Network

### Junctions

## Proposed Layout - 2037LG, AM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Demand Sets	D17 - 2037LG, AM	Time results are shown for central hour only. (Model is run for a 90 minute period.)
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.

## Junction Network

### Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
1	Junction 6	Standard Roundabout		1, 2, 3, 4	8.75	A

## Proposed Layout - 2023HG, AM

### Data Errors and Warnings

Severity	Area	Item	Description
Warning	Demand Sets	D21 - 2023HG, AM	Time results are shown for central hour only. (Model is run for a 90 minute period.)
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs. If HV% at the junction is genuinely zero, please ignore this warning.

## Junction Network

### Junctions

# Appendix W – Kirk Hill Scheme Drawings and LINSIG Outputs

- NOTES**
1. This drawing is to be read in conjunction with all other relevant drawings, details and specifications.
  2. Do not scale from this drawing.
  3. All measurements are given in metres unless otherwise stated.
  4. For accident data refer to Feasibility Study document.
  5. Refer to drawing HW 30676/014 for statutory undertakers information.

- KEY**
- Proposed carriageway
  - Proposed grass verge
  - Proposed retaining wall

----------	-------	-------	-------	---	-----	-----	---	-----	-----	---	------	------	---

NOTE: The cost of any EU Allowances (EUAs) purchased to cover traded emissions (i.e. emissions from sectors covered by the EU Emissions Trading System) will be reflected in the purchase price of traded sector goods (such as electricity). Since the purchase price is used in the costs, considered in transport appraisal, the cost of the relevant EUAs will be included in the cost benefit analysis, "internalising" the costs of emissions from traded sectors.

The CO2 EMISSIONS BY TIME PERIOD TRADED reported in the table below are therefore provided for information purposes only - they are not included in the Economic Efficiency of the Transport System (TEE) table.

For further information, please refer to TAG Unit A-3 para. 4.1.5 and 4.2.9

Analysis of Monetised Costs and Benefits

Greenhouse Gases	-57
------------------	-----

Economic Efficiency: Consumer Users (Commuting)	6617
Economic Efficiency: Consumer Users (Other)	8941
Economic Efficiency: Business Users and Providers	6618
Wider Public Finances (Indirect Taxation Revenues)	156
Present Value of Benefits (PVB)	22275
Broad Transport Budget	7070
Present Value of Costs (PVC)	7070

#### OVERALL IMPACTS

Net Present Value (NPV)	15205
Benefit to Cost Ratio (BCR)	3.151

Note: This table includes costs and benefits which are regularly or occasionally presented in monetised form in transport appraisals, together with some where monetisation is in prospect. There may also be other significant costs and benefits, some of which cannot be presented in monetised form. Where this is the case, the analysis presented above does NOT provide a good measure of value for money and should not be used as the sole basis for decisions.
